## Notes

To understand CSS, you have to understand the DOM (Document Object Model). A rendering

# FORMATTING GUIDE

Great!

Don't

Horrible

Broken

Symbol Key

## *Separation of Concerns*

Divide computer program into separate *concerns*, each focusing on a specific resource

*Meaning: HTML*

*Presentation: CSS*

*Behavior: JavaScript*

Note: there are exceptions to each of these!

Semantic

HTML

There has been an increased focus by the W3C over the last decade on *semantic HTML*

Semantic HTML is based on the idea that HTML should better help search engines, screen readers, & parsers understand what content *means* on the webpage

Some elements carry a strong semantic meaning, while others carry a (very) weak semantic meaning & are there for developer convenience

`<article>` describes the meaning of the content, while `<div>` is just a box with no meaning

`<strong>` means that the text is strongly emphasized by making it bold, while `<b>` just means make it bold for no particular reason

## Semantic

```
<p>  
  Shoggoth  
</p>  
<p>  
  Shub-Niggurath  
</p>
```

These are 2 paragraphs

Works with CSS

## Not semantic

```
<p>  
  Shoggoth  
<br>  
<br>  
  Shub-Niggurath  
</p>
```

This is 1 paragraph, not 2!

Will cause CSS problems

## Why use semantic HTML?

- » It's correct
- » Better accessibility
- » Easier to read the code
- » Helps CSS work correctly
- » Search engines & assistive tools like it

`<article>`

`<nav>`

`<aside>`

`<section>`

`<figure>`

`<details>`

`<footer>`

`<summary>`

`<header>`

`<time>`

HTML5 added many new semantic elements

One of the goals of HTML 5: “paving the cowpaths” or “following the desire lines”

HTML 4.01  
Non-semantic

HTML5  
Semantic

```
<div class="header">
```

```
<header>
```

```
<div class="footer">
```

```
<footer>
```

```
<div id="nav">
```

```
<nav>
```

```
<div id="sidebar">
```

```
<aside>
```

# Categorization

HTML 4.01 consists of 91 elements that tell the web browser about the webpage's structure & appearance

HTML5 consists of 115 elements, with 31 obsolete or deprecated

# Periodic Table of the HTML Elements

html																col	table
head	span									div	fieldset	form	body	h1	section	colgroup	tr
title	a									pre	meter	select	aside	h2	header	caption	td
meta	rt	dfn	em	i	small	ins	s	br	p	blockquote	legend	optgroup	address	h3	nav	menu	th
base	rp	abbr	time	b	strong	del	kbd	hr	ol	dl	label	option	datalist	h4	article	command	tbody
link	noscript	q	var	sub	mark	bdi	wbr	figcaption	ul	dt	input	output	keygen	h5	footer	summary	thead
style	script	cite	samp	sup	ruby	bdo	code	figure	li	dd	textarea	button	progress	h6	hgroup	details	tfoot

img	area	map	embed	object	param	source	iframe	canvas	track	audio	video
-----	------	-----	-------	--------	-------	--------	--------	--------	-------	-------	-------

- Root element
- Metadata and scripting
- Embedding content
- Text-level semantics
- Grouping content
- Forms
- Document sections
- Tabular data
- Interactive elements

# Ways to categorize HTML elements

- » Content categories
- » Type
- » Function

# Content Categories

HTML 4.01 categorized virtually all elements into 1 or 2 categories: *block-level* or *inline*

HTML5 supersedes that simple categorization with a (much) more detailed set of *content categories*

HTML5 *content models* describe the allowed contents of elements

Basically, they determine what elements can correctly go inside other elements

To be technical about it, allowed content can include...

- » *Content categories* that group elements with similar characteristics together
- » Specific elements
- » Specific attributes
- » Hierarchy
- » Text or embedded multimedia

**Categories:**

Flow content.

Palpable content.

Content categories

Parents:

**Contexts in which this element can be used:**

Where flow content is expected.

Children:

**Content model:**

Flow content but with no heading content descendants, no sectioning content descendants, and no header, footer, or address element descendants.

**Tag omission in text/html:**

Neither tag is omissible.

**Content attributes:**

Global attributes

**DOM interface:**

Uses HTMLElement.

The address element represents the contact information for its nearest article or body

Parents: **Content categories:**

Children: Permitted content:

## Content categories

Tag omission:

Permitted parent elements: Any element that accepts **flow content**.

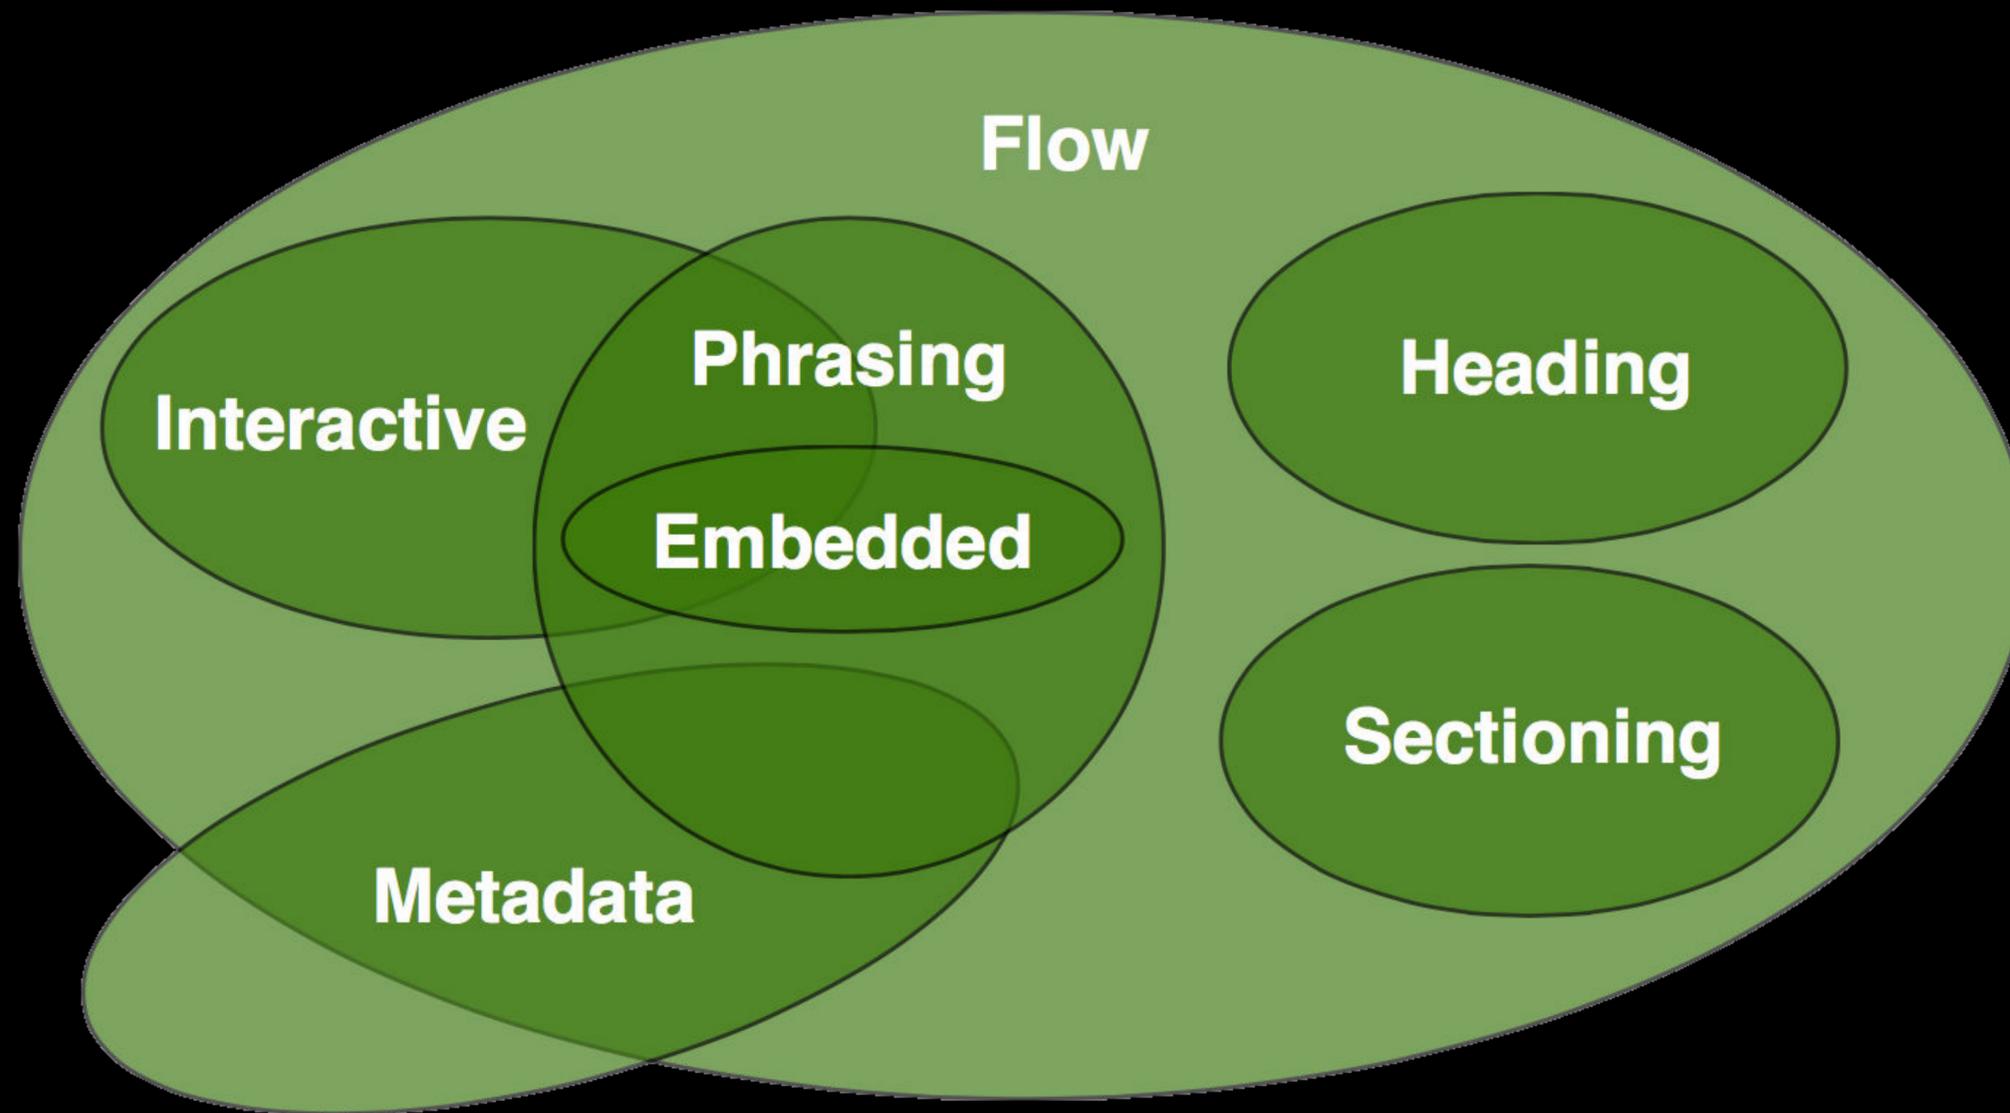

DOM interface:

**Flow content**, palpable content.

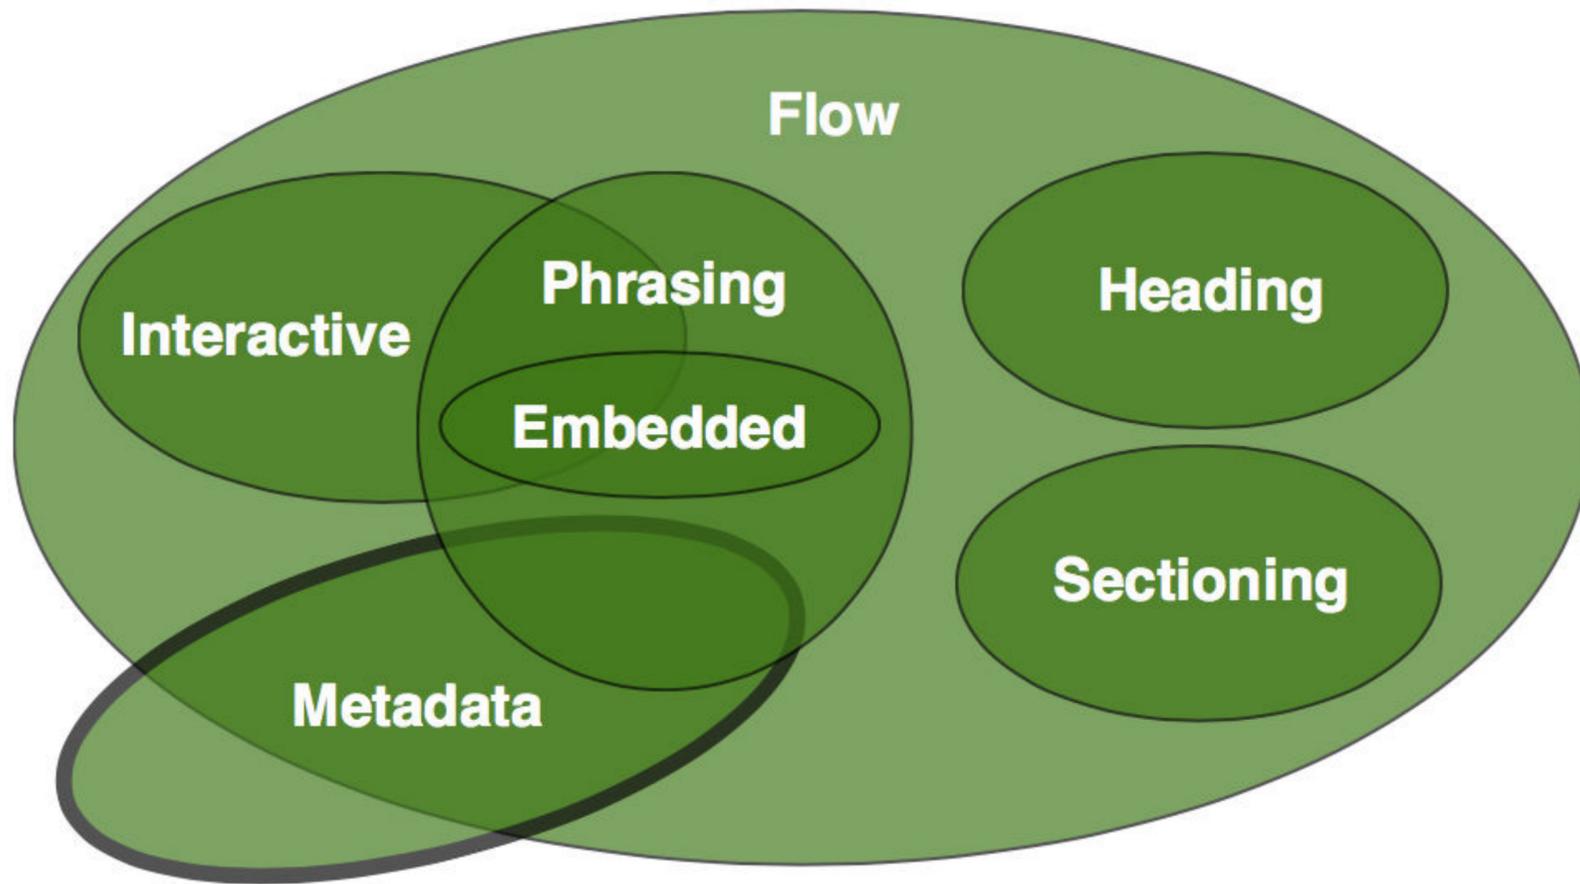

**Flow content**, but with no nested `<address>` element, no **heading content** (`<hgroup>`, `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>`), no **sectioning content** (`<article>`, `<aside>`, `<section>`, `<nav>`), and no `<header>` or `<footer>` element.

None, both the starting and ending tag are mandatory.

`HTMLElement` Prior to Gecko 2.0 (Firefox 4), Gecko implemented this element using the `HTMLSpanElement` interface

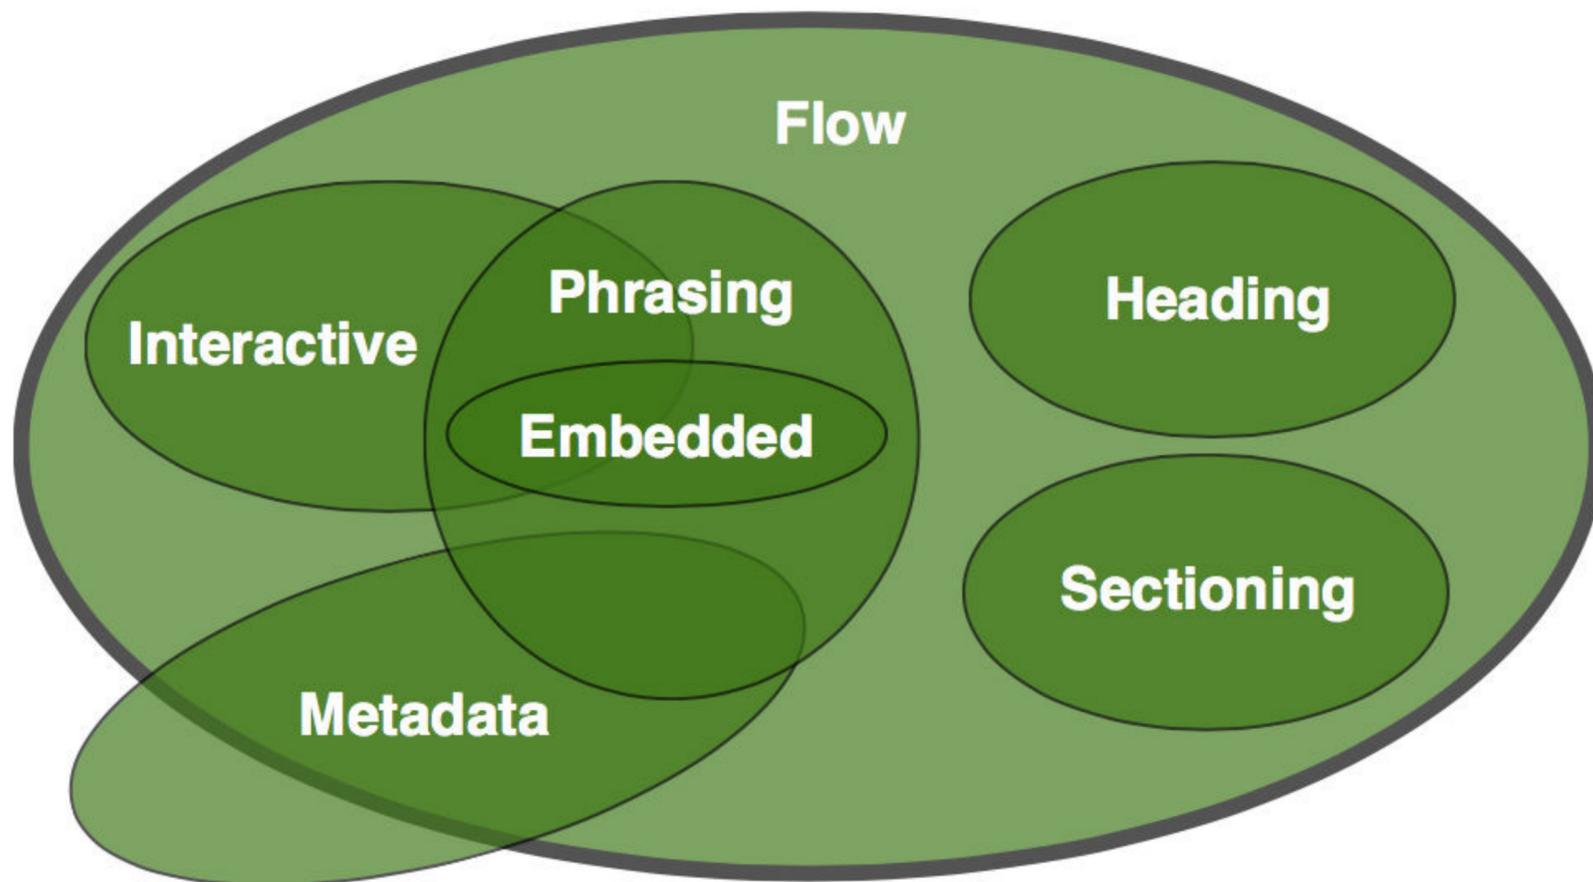

Every HTML element falls into zero or more content categories

## Metadata content

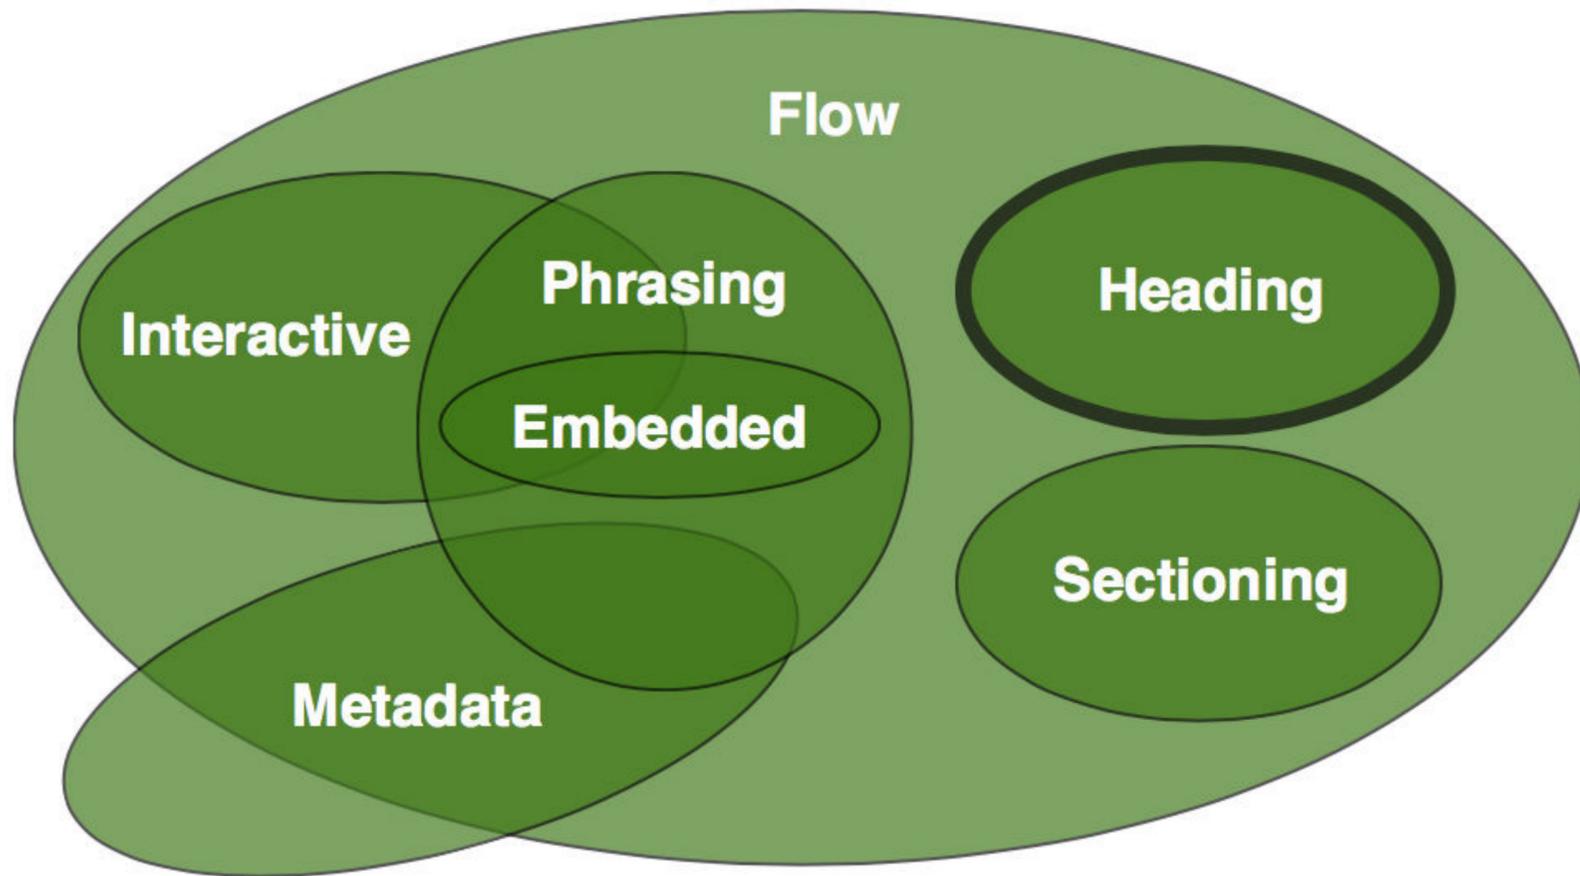

`base, link, meta, noscript, script, style, template, title`

## Flow content

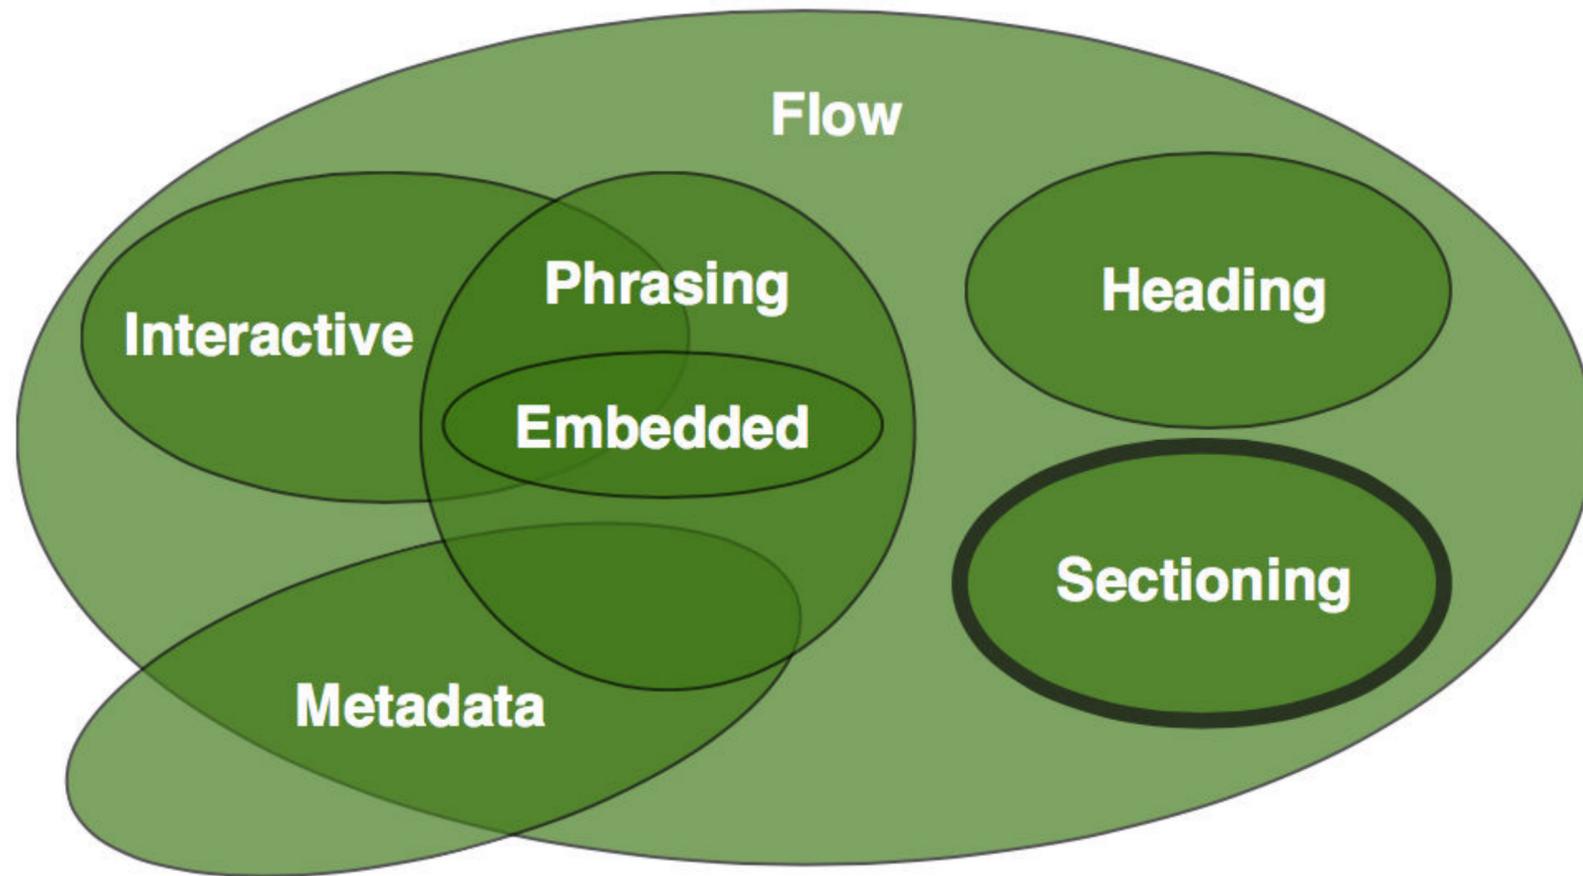

`a`, `abbr`, `address`, `area*`, `article`, `aside`, `audio`, `b`, `bdi`, `bdo`, `blockquote`, `br`, `button`, `canvas`, `cite`, `code`, `data`, `date`, `datalist`, `del`, `details`, `dfn`, `dialog`, `div`, `dl`, `em`, `embed`, `fieldset`, `figure`, `footer`, `form`, `h1`, `h2`, `h3`, `h4`, `h5`, `h6`, `header`, `hgroup`, `hr`, `i`, `iframe`, `img`, `input`, `ins`, `kbd`, `keygen`, `label`, `link*`, `main`, `map`, `mark`, `math`, `menu`, `meta*`, `meter`, `nav`, `noscript`, `object`, `ol`, `output`, `p`, `pre`, `progress`, `q`, `ruby`, `s`, `samp`, `script`, `section`, `select`, `small`, `span`, `strong`, `style*`, `sub`, `sup`, `svg`, `table`, `template`, `textarea`, `time`, `u`, `ul`, `var`, `video`, `wbr`, `Text*`

*\* Under certain circumstances (see prose).*

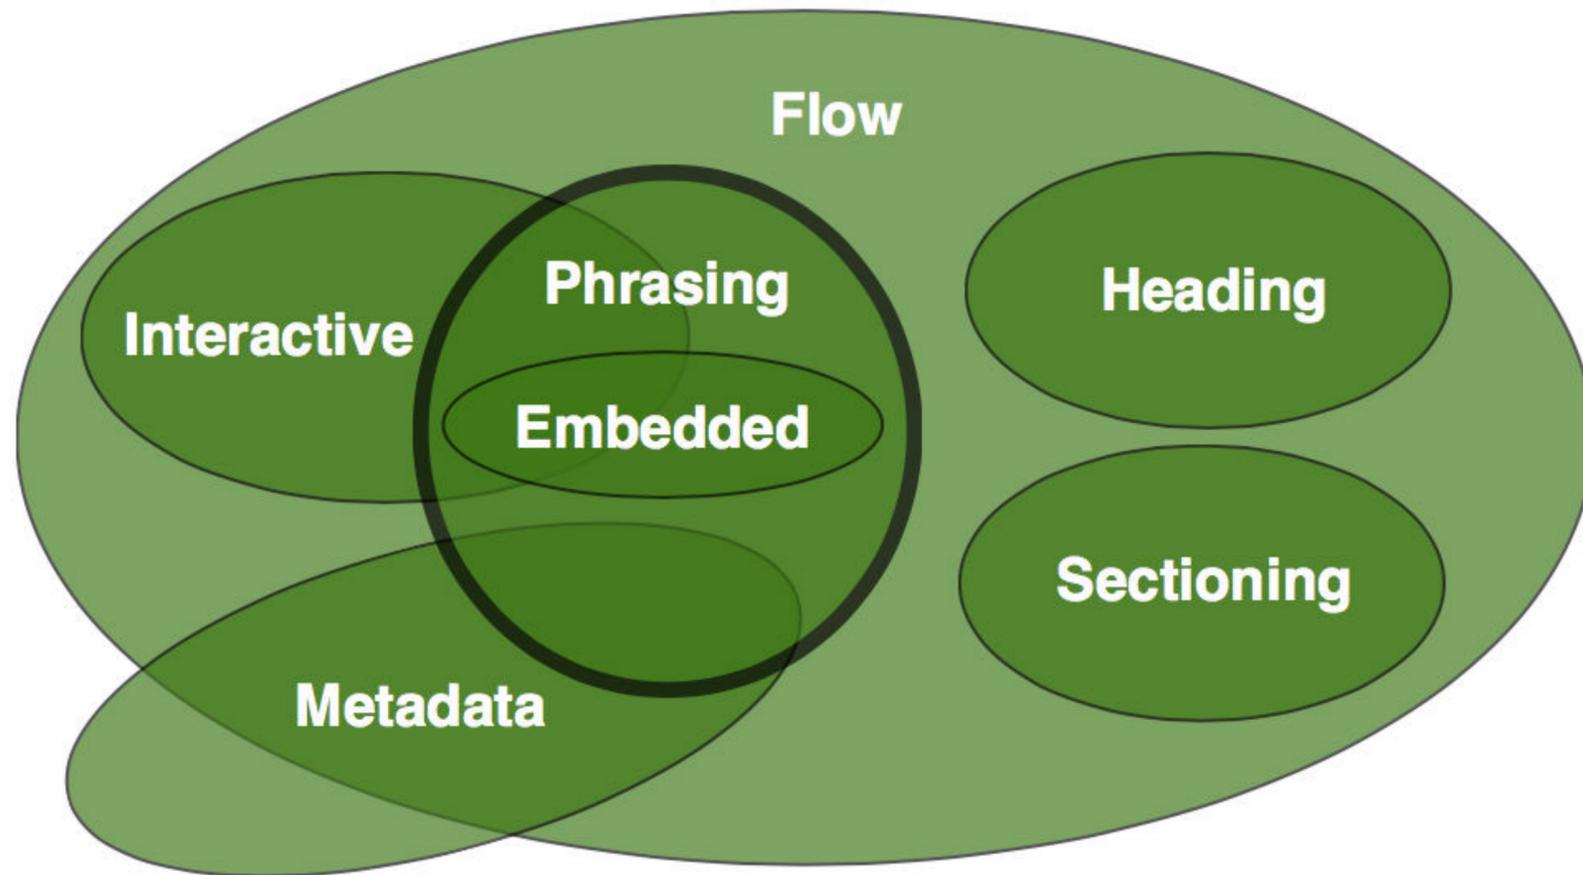

## Heading content

`h1`, `h2`, `h3`, `h4`, `h5`, `h6`, `hgroup`

## Sectioning content

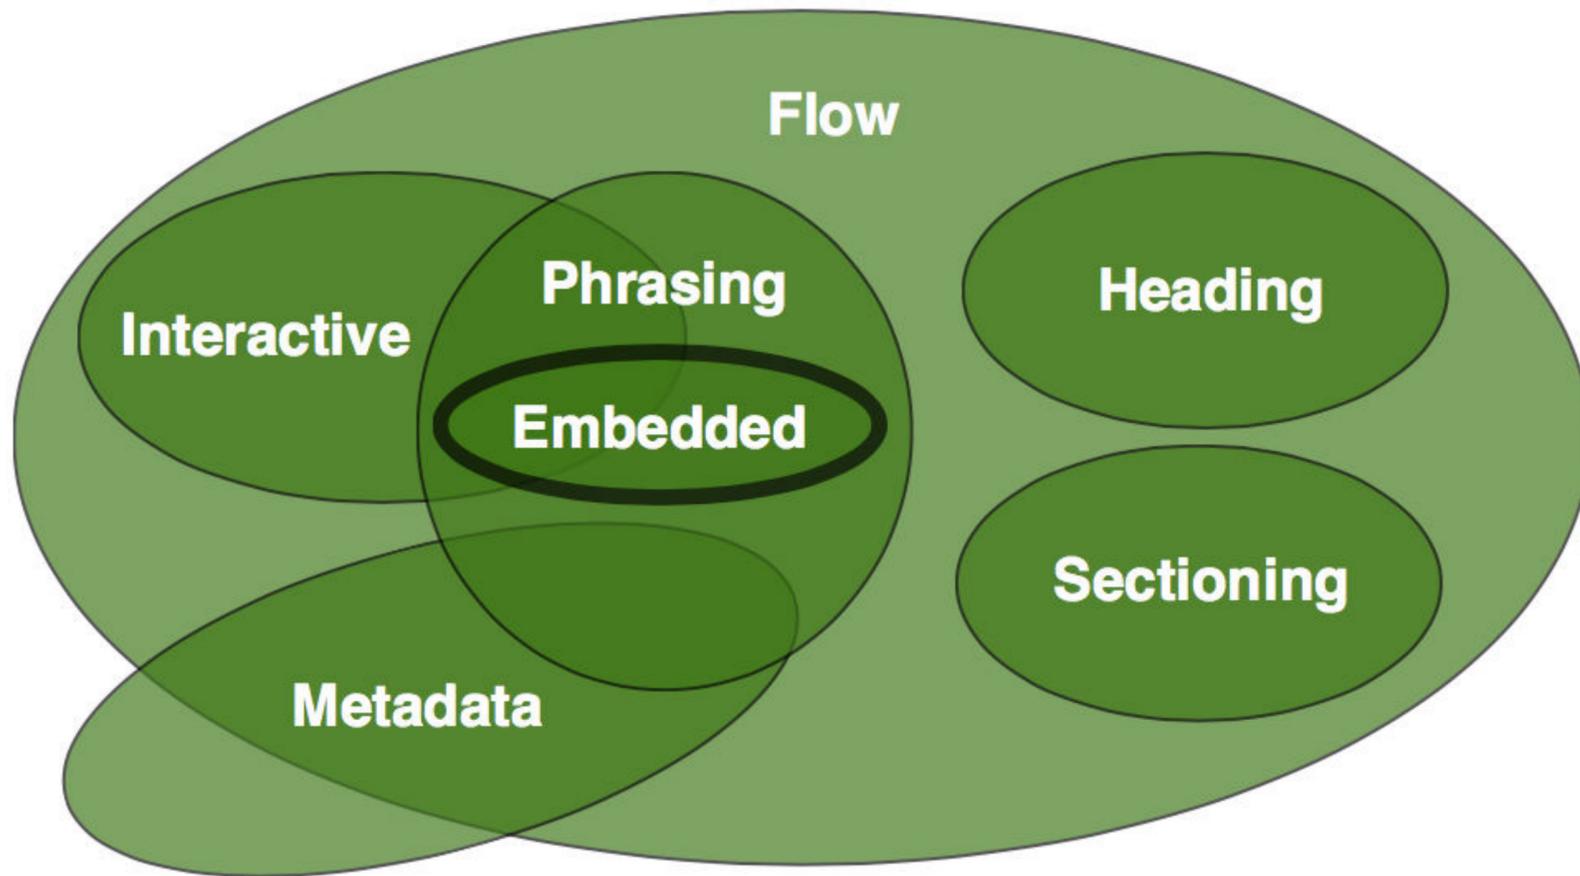

`article, aside, nav, section`

## Phrasing content

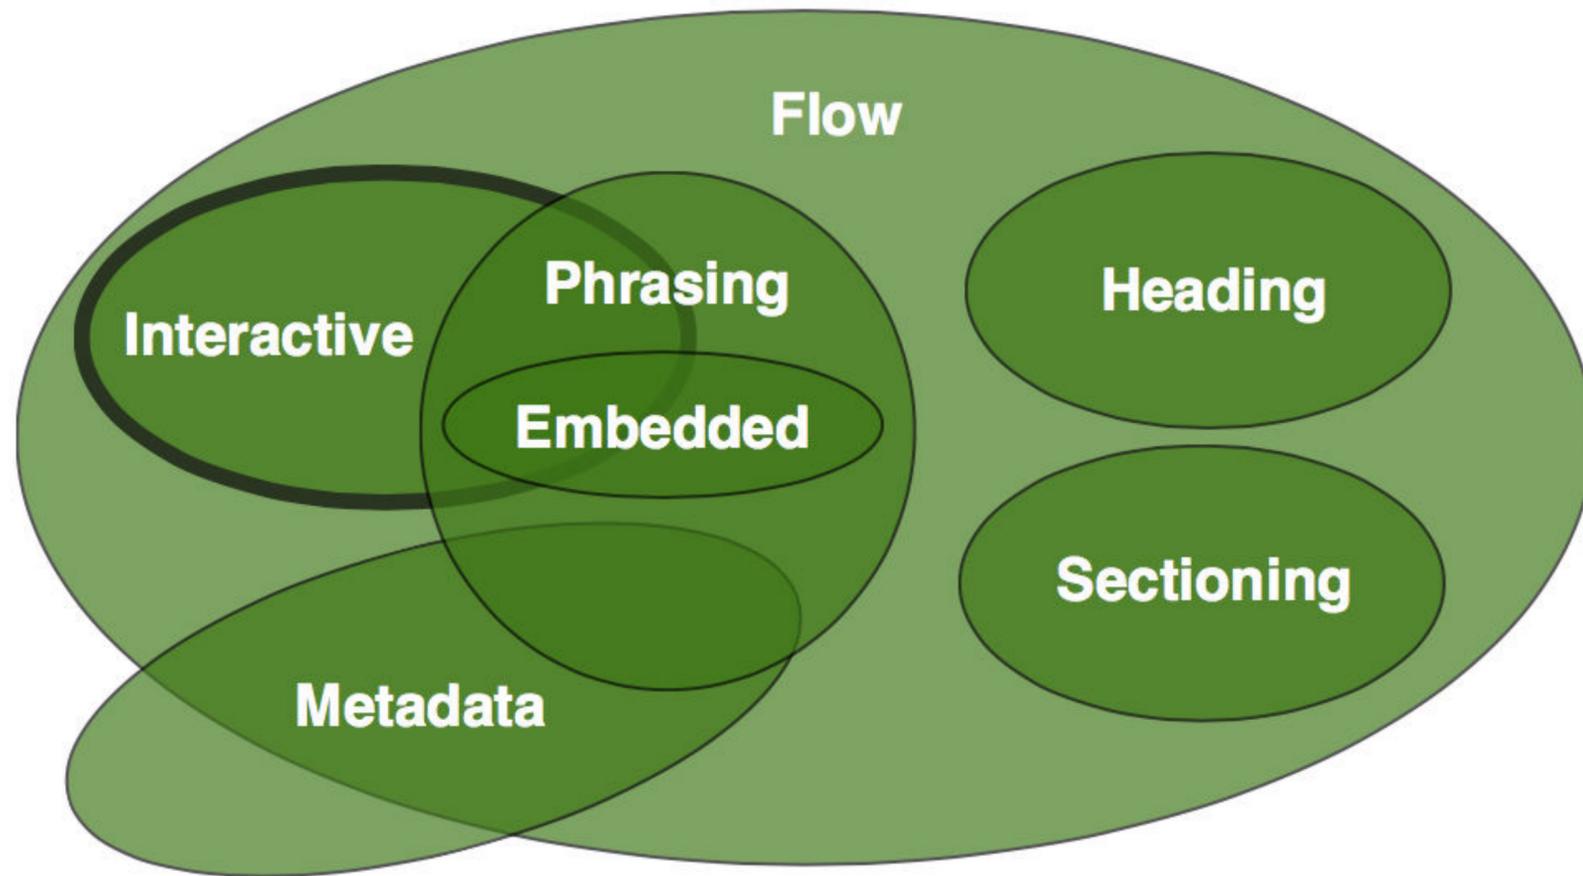

`a*`, `abbr`, `area*`, `audio`, `b`, `bdi`, `bdo`, `br`, `button`, `canvas`, `cite`, `code`, `data`, `date`, `datalist`, `del*`, `dfn`, `em`, `embed`, `i`, `iframe`, `img`, `input`, `ins*`, `kbd`, `keygen`, `label`, `link*`, `map*`, `mark`, `math`, `meta*`, `meter`, `noscript`, `object`, `output`, `progress`, `q`, `ruby`, `s`, `samp`, `script`, `select`, `small`, `span`, `strong`, `sub`, `sup`, `svg`, `template`, `textarea`, `time`, `u`, `var`, `video`, `wbr`, `Text*`

*\* Under certain circumstances; see prose.*

## Embedded content

audio, canvas, embed, iframe, img, math, object, svg, video

## Interactive content

`a`, `audio*`, `button`, `details`, `embed`, `iframe`, `img*`, `input*`, `keygen`,  
`label`, `object*`, `select`, `textarea`, `video*`

*\* Under certain circumstances.*

Type

HTML5 spec defines 6 different kinds of elements:

- » void elements: `area`, `base`, `br`, `col`, `embed`, `hr`, `img`, `input`, `link`, `meta`, `param`, `source`, `track`, `wbr`
- » the `template` element
- » raw text elements: `script` & `style`
- » escapable raw text elements: `textarea` & `title`
- » foreign elements: MathML & SVG
- » normal elements: everything else

## SIDE NOTE

*Raw text elements* can have text

*Escapable raw text elements* can have text & character references, but text cannot contain “an ambiguous ampersand”

That means you have to use *character encoding* to encode an ampersand as `&amp;` (more on this later)

Function

HTML elements are often grouped by function

WHATWG (maintainers of the HTML Living Standard)  
& MDN (Mozilla Developer Network) have similar  
categorizations, with some differences

WHATWG	MDN
Document	Main root
Document metadata	Document metadata
Sections	Sectioning root
	Content sectioning
Grouping	Text content
Text-level semantics	Inline text semantics
Links	
Edits	Demarcating edits

WHATWG	MDN
Embedded content	Image & multimedia
	Embedded content
Tabular data	Table content
Forms	Forms
Interactive elements	Interactive elements
Scripting	Scripting
	Web Components
—	Obsolete & deprecated elements

## WHATWG: Embedded

`<area>`  
`<audio>`  
`<embed>`  
`<iframe>`  
`<img>`  
`<map>`  
`<object>`  
`<param>`  
`<picture>`  
`<source>`  
`<track>`  
`<video>`

## MDN: Image & multimedia

`<area>`  
`<audio>`  
`<img>`  
`<map>`  
`<track>`  
`<video>`

## MDN: Embedded content

`<embed>`  
`<iframe>`  
`<object>`  
`<param>`  
`<picture>`  
`<source>`

In particular, 3 groups are very closely related

*Sectioning* elements divide the webpage up into areas, e.g., navigation, articles, headings, & footers

*Grouping* elements group content within sections, e.g., paragraphs, lists, figures, & dividing lines

*Text semantic* elements add meaning to words & phrases inside a group, e.g., emphasis, bold, code, subscript, & abbreviation

# Basic Document Structure

```
<html>
```

```
<head>
```

```
<body>
```

```
<html> ... </html>
```

*Root* of the HTML document

Tells rendering engines where HTML starts & ends

`<head> ... </head>`

Contains:

- » *Information & metadata* primarily for rendering engines, computers, & searchbots
- » *Resources* (CSS & JavaScript) for displaying the page

```
<body> ... </body>
```

*Content that appears in the viewport* for humans to see & use

Sectioning root for the content on the webpage (more in *Sectioning* later)

```
<html>  
  <head>  
    ...  
  </head>  
  <body>  
    ...  
  </body>  
</html>
```

Metadata

<title>

<meta>

<base>

<link>

<style>

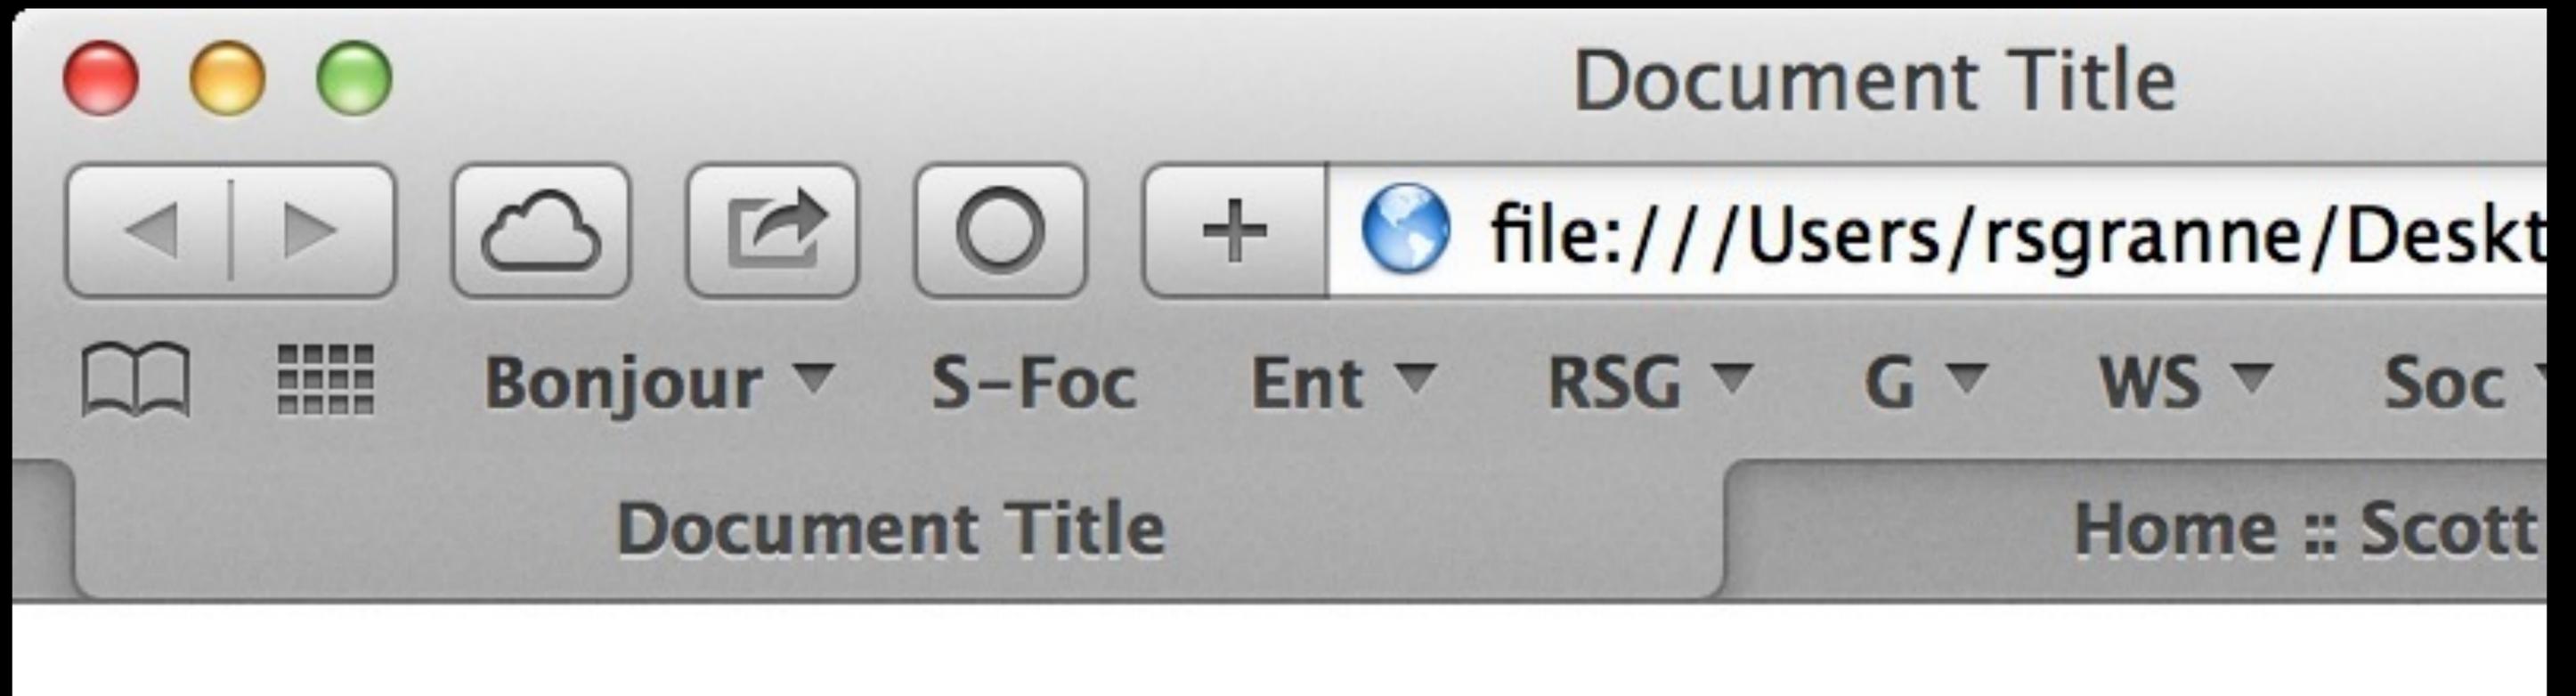

<script>

```
<title> ... </title>
```

*Title* of the webpage used by browsers, computers, & search bots

Appears by default for humans to see in...

- » Tab bar
- » Bookmarks
- » Title bar

```
<head>  
  <title>Document Title</title>  
</head>
```

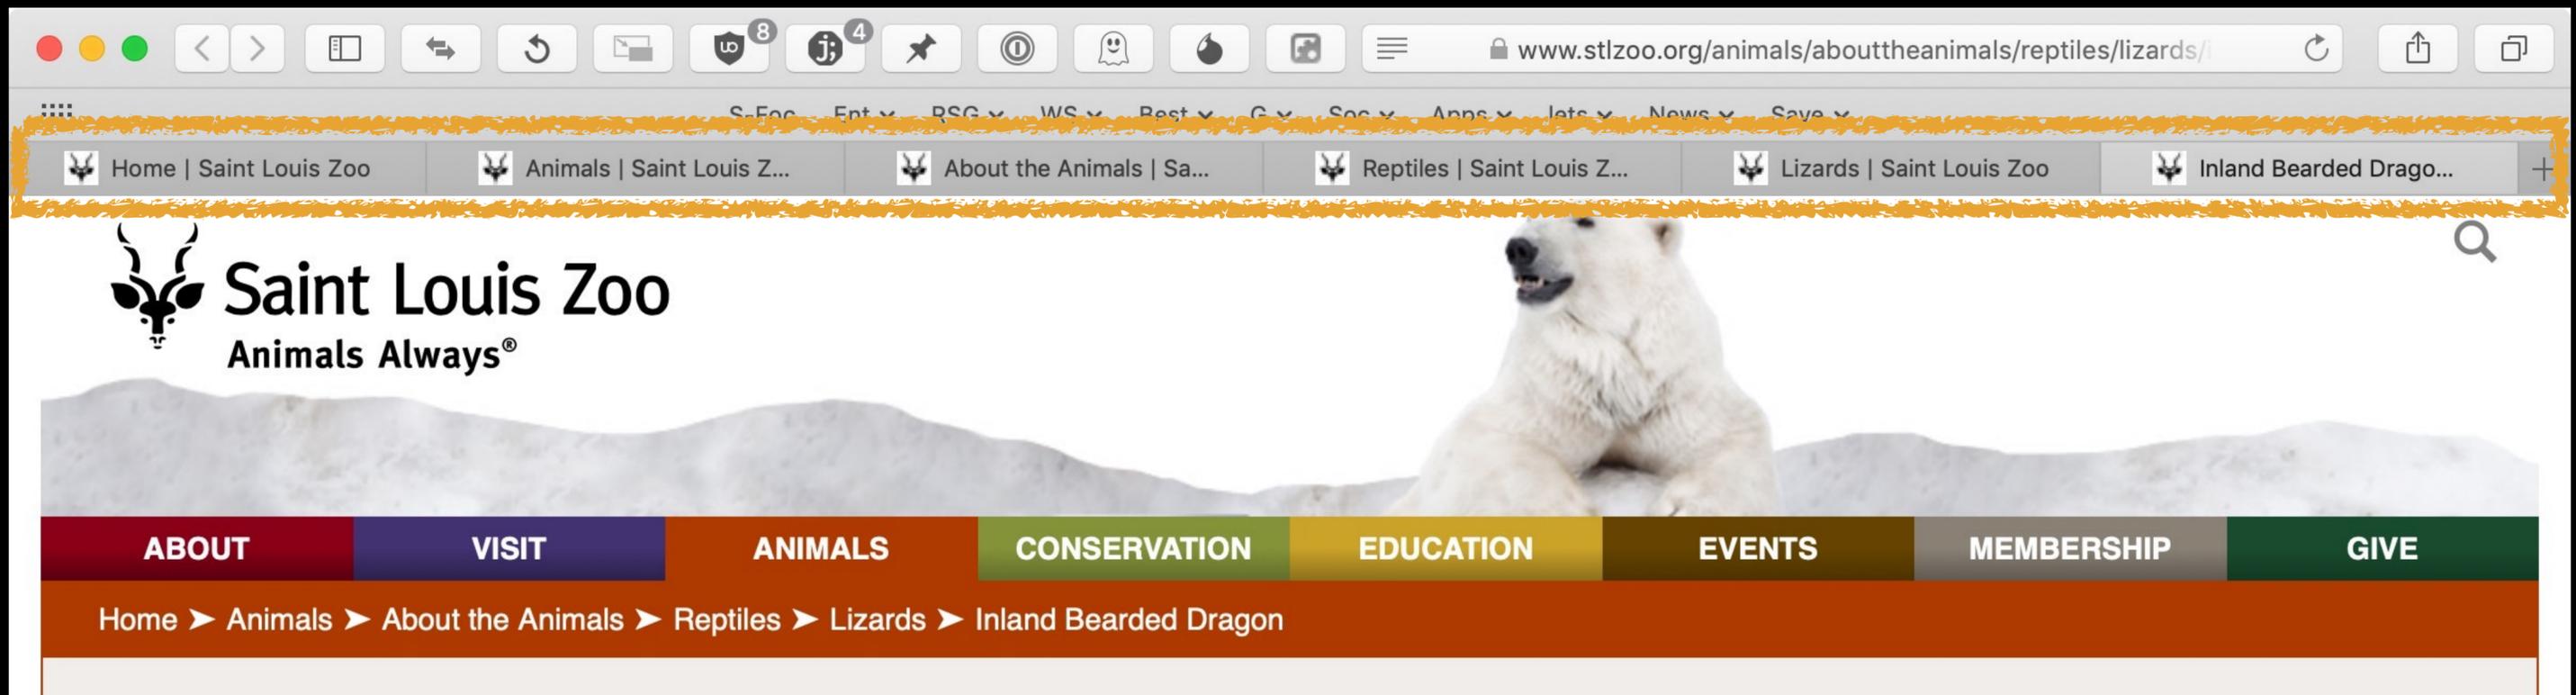

`<title>` should include both the title of the page & the name of the website — for the user & for SEO

Page should go first, then a separator, & then the site

```
<title>Assignments | Scott Granneman</title>
```

```
<title>Technology - The New York Times</title>
```

```
<title>Site Map :: WebSanity Help</title>
```

`<title>Animals – Saint Louis Zoo</title>`

Why the page first & then the site?

So the page title shows up on tabs, not the site

`<meta>`

Specifies *metadata*: information about the document instead of the document content

No closing `</meta>`!

Can have several `<meta>` elements in `<head>`

```
<head>
```

```
  <meta charset="utf-8">
```

```
  <meta name="description" content="Do NOT  
read this!">
```

```
  <meta name="viewport" content="width=device-  
width, initial-scale=1, shrink-to-fit=no">
```

```
</head>
```

Useful but not vital

Use with responsive (later!)

```
<meta name="description" content="The  
Necronomicon is a fictional grimoire appearing  
in stories by horror writer H. P. Lovecraft  
and his followers">
```

Description of the document, used by some search engines

```
<meta name="keywords" content="grimoire, H. P.  
Lovecraft, philosophy, history, Cthulhu">
```

Search terms associated with the document, used by very few search engines, so hardly worth including

```
<meta name="description" content="The  
Necronomicon is a fictional grimoire appearing  
in stories by horror writer H. P. Lovecraft  
and his followers">
```

Description of the document, used by some search engines

```
<meta name="keywords" content="grimoire, H. P.  
Lovecraft, philosophy, history, Cthulhu">
```

Search terms associated with the document, used by very few search engines, so hardly worth including

|                  |               |
|------------------|---------------|
| apple-itunes-app | pinterest     |
| bitcoin          | rating        |
| contact          | review_date   |
| creator          | robots        |
| designer         | skype_toolbar |
| google-play-app  | twitter:card  |
| googlebot        | version       |

Possible values for `<meta name="">` taken from the WHATWG Wiki MetaExtensions page, which are in wide use but are not standardized (over 350 listed!)

`<link>`

Specifies *relationships between document & external resources*

More on this later when we get to the Links section

```
<style> ... </style>
```

*CSS embedded* in the HTML document

You should almost never do this—use linked CSS instead (later!)

```
<script> ... </script>
```

*JavaScript*

More on this later when we get to the *Scripting* section

# Attributes & Values

```
<h1 align="center"> ... </h1>
```

`h1` is an *tag name* (but most people call it an *element*)

`align` is an *attribute*

`center` is a *value*

`align="center"` is an *attribute-value pair*

Attributes can be categorized

- » Global
- » Limited
- » Custom

# Global Attributes

*Global attributes* are attributes common to all elements  
(even those on which they have no effect!)

At this time, there are ~24 global attributes

CSS: `class`, `id`, `style`

Interactivity: `accesskey`, `draggable`, `hidden`, `tabindex`,  
`title`, `contenteditable`, `autocapitalize`, `inputmode`,  
`spellcheck`

I18n (*internationalization*): `dir`, `lang`, `translate`

Microdata: `itemid`, `itemprop`, `itemref`, `itemscope`,  
`itemtype`

Customization: `data-*`

Accessibility: `aria-*`

Web Components: `is`, `slot`, `part`, `exportparts`

JavaScript event handlers: `on*`

Some of these attributes are complex & require certain elements to really do something

I18n only encompasses 3 attributes — `dir`, `lang`, & `translate` — but it is a very complicated subject

Web Components allow you to combine HTML elements, 4 global attributes (`is`, `slot`, `part`, & `exportparts`), CSS, & JavaScript to create *custom elements* for your web apps — this is not simple stuff!

Let's look at a few of the simpler global attributes now

The rest will have info about them in the Bonus section at the end of these slides, or will be covered in other presentations

class

id

style

title

```
class=""
```

Assign *CSS class(es)* to the element

Covered later when we get to CSS

Note: also used with JavaScript

`id=""`

Creates *page fragment* which can be used when linking

Also assigns *CSS ID(s)* to the element

Covered later when we get to CSS & Links

Note: also used with JavaScript

```
style=""
```

Applies *inline CSS* to the element

Don't use it—there are better methods

Covered later when we get to CSS

```
title=""
```

*Advisory or descriptive information* about the element, e.g.:

- » Description of link
- » Credits for image
- » Footnote
- » Information about author

Usually displayed as a tooltip

```
1 <figure title="One of my favorite pictures of Libby
  as a puppy">
2   
3   <br><figcaption>Source: <a
  href="http://granneman.com" title="Taken by Scott
  Granneman">Scott Granneman</a></figcaption>
4 </figure>
```

Source: [Scott Granneman](http://granneman.com)

@karlgroves

If I found a genie and it gave me one wish, it would be that web developers stopped using the title attribute

5:17 PM · Dec 15, 2017

Browser support is problematic!

Tooltips render with small, bad fonts & ugly boxes, & they are un-stylable with CSS so you can't fix them

Lack of consistency — default tooltips are displayed differently depending upon browser & operating system

For instance, what happens if you use a 5,000-character value for `title`?

```

# Ph'nglui mglw'nafh Cthulhu R'lyeh wgah'nagl fhtagn!

The most merciful thing in the world, I think, is the inability of the human mind to correlate all its contents. We live on a placid island of ignorance in the midst of black seas of infinity, and it was not meant that we should voyage far. The sciences, each straining in its own direction, have hitherto harmed us little; but some day the piecing together of dissociated knowledge will open up such terrifying vistas of reality, and of our frightful position therein, that we shall either go mad from the revelation or flee from the deadly light into the peace and safety of a new dark age.

Theosophists have guessed at the awesome grandeur of the cosmic cycle wherein our world and human race form transient incidents. They have hinted at strange survivals in terms which would freeze the blood if not masked by a bland optimism. But it is not from them that there came the single glimpse of forbidden aeons which chills me when I think of it and maddens me when I dream of it. That glimpse, like all dread glimpses of truth, flashed out from an accidental piecing together of separated things—in this case an old newspaper item and the notes of a dead professor. I hope that no one else will accomplish this piecing out; certainly, if I live, I shall never knowingly supply a link in so hideous a chain. I think that the professor, too, intended to keep silent regarding the part he knew, and that he would have destroyed his notes had not sudden death seized him.

My knowledge of the thing began in the winter of 1926–27 with the death of my grand-uncle George Gammell Angell, Professor Emeritus of Semitic Languages in Brown University, Providence, Rhode Island. Professor Angell was widely known as an authority on ancient inscriptions, and had frequently been resorted to by the heads of prominent museums; so that his passing at the age of ninety-two may be recalled by many. Locally, interest was intensified by the obscurity of the cause of death. The professor had been stricken whilst returning from the Newport boat; falling suddenly, as witnesses said, after having been jostled by a nautical-looking negro who had come from one of the queer dark courts on the precipitous hillside which formed a short cut from the waterfront to the deceased's home in Williams Street. Physicians were unable to find any visible disorder, but concluded after perplexed debate that some obscure lesion of the heart, induced by the brisk ascent of so steep a hill by so elderly a man, was responsible for the end. At the time I saw no reason to dissent from this dictum, but latterly I am inclined to wonder—and more than wonder.

As my grand-uncle's heir and executor, for he died a childless widower, I was expected to go over his papers with some thoroughness; and for that purpose moved his entire set of files and boxes to my quarters in Boston. Much of the material which I correlated will be later published by the American Archaeological Society, but there was one box which I found exceedingly puzzling, and which I felt much averse from shewing to other eyes. It had been locked, and I did not find the key till it occurred to me to examine the personal ring which the professor carried always in his pocket. Then indeed I succeeded in opening it, but when I did so seemed only to be confronted by a greater and more closely locked barrier. For what could be the meaning of the queer clay bas-relief and the disjointed jottings, ramblings, and cuttings which I found? Had my uncle, in his latter years, become

The most merciful thing in the world, I think, is the inability of the human mind to correlate all its contents. We live on a placid island of ignorance in the midst of black seas of infinity, and it was not meant that we should voyage far. The sciences, each straining in its own direction, have hitherto harmed us little; but some day the piecing together of dissociated knowledge will open up such terrifying vistas of reality, and of our frightful position therein, that we shall either go mad from the revelation or flee from the deadly light into the peace and safety of a new dark age. Theosophists have guessed at the awesome grandeur of the cosmic cycle wherein our world and human race form transient incidents. They have hinted at strange survivals in terms which would freeze the blood if not masked by a bland optimism. But it is not from them that there came the single glimpse of forbidden aeons which chills me when I think of it and maddens me when I dream of it. That glimpse, like all dread glimpses of...

Edge 83 on Windows shows 836 characters & then cuts it off with an ...

The most merciful thing in the world, I think, is the inability of the human mind to correlate all its contents. We live on a placid island of ignorance in the midst of black seas of infinity, and it was not meant that we should voyage far. The sciences, each straining in its own direction, have hitherto harmed us little; but some day the piecing together of dissociated knowledge will open up such terrifying vistas of reality, and of our frightful position therein, that we shall either go mad from the revel

Ph'nglui mglw'nafh Cthulhu R'lyeh wgah'nagl fhtagn!

IE 11 on Windows shows 421 characters & then cuts it off

Other problems

No default visual indicator that they're available

Delay before appearing

Keyboard-only users cannot get the tooltip to appear

Biggest problem is on mobile

By default, the `title` attribute doesn't display anything on mobile devices, because there's no hover!

You can build your own for mobile, e.g., Bootstrap takes the value of `title` & displays it as a tooltip using `popper.js` — & it works using the keyboard only

HTML doesn't work with **title** by default

And with custom HTML added:

```

<button type="button" class="btn btn-secondary" data-toggle="tooltip" data-html="true" title="<em>Tooltip</em> <u>with</u> <b>HTML</b>">
  Tooltip with HTML
</button>

```

Don't just shove a `title` on an element & consider it done

You will have (potentially a lot of) additional work ahead of you

				ios		
class	6*	2	Y	Y	Y	Y
id	6*	2	Y	Y	Y	Y
style	6*	2	Y	Y	Y	Y

\* At least

						
<code>title</code>	6*	2	Y	—	Y	—

\* At least

Limited Attributes

Limited attributes are assigned to specific elements

**Categories:**

[Flow content](#).

If the element's children include at least one **li** element: [Palpable content](#).

**Contexts in which this element can be used:**

Where [flow content](#) is expected.

**Content model:**

Zero or more **li** and [script-supporting](#) elements.

**Tag omission in text/html:**

Neither tag is omissible.

**Content attributes:**

[Global attributes](#)

**reversed** — Number the list backwards

**start** — [Starting value](#) of the list

**type** — Kind of list marker

**<ol>** supports global attributes  
+ **reversed, start, & type**

**Accessibility considerations:**

[For authors](#).

[For implementers](#).

**DOM interface:**

```
IDL [Exposed=Window]
interface HTMLListElement : HTMLElement {
    [HTMLConstructor] constructor();
}
```

## Content attributes:

### [Global attributes](#)

**accept** — Hint for expected file type in [file upload controls](#)

**alt** — Replacement text for use when images are not available

**autocomplete** — Hint for form autofill feature

**checked** — Whether the control is checked

**dirname** — Name of form control to use for sending the element's [directionality](#) in [form submission](#)

**disabled** — Whether the form control is disabled

**form** — Associates the element with a **form** element

**formaction** — [URL](#) to use for [form submission](#)

**formenctype** — Entry list encoding type to use for [form submission](#)

**formmethod** — Variant to use for [form submission](#)

**formnovalidate** — Bypass form control validation for [form submission](#)

**formtarget** — [Browsing context](#) for [form submission](#)

**height** — Vertical dimension

**list** — List of autocomplete options

**max** — Maximum value

**maxlength** — Maximum [length](#) of value

**min** — Minimum value

**minlength** — Minimum [length](#) of value

**multiple** — Whether to allow multiple values

**name** — Name of the element to use for [form submission](#) and in the **form.elements** API

**pattern** — Pattern to be matched by the form control's value

**placeholder** — User-visible label to be placed within the form control

**readonly** — Whether to allow the value to be edited by the user

**required** — Whether the control is required for [form submission](#)

**size** — Size of the control

**src** — Address of the resource

**step** — Granularity to be matched by the form control's value

**type** — Type of form control

**value** — Value of the form control

**width** — Horizontal dimension

Also, the **title** attribute [has special semantics](#) on this element: Description of pattern (when used with **pattern** attribute).

`<input>` supports global attributes  
+ 30 more!

# Custom Attributes

`data-*=""`

Allow developers to store *custom data* unique to a page, site, or application to create *custom attributes* to serve their needs

For example, WebSanity created `data-display` to use with FormSanity

Yes, `data-*` is a global attribute, but it is unique from the others

## Rules for names

- » Cannot contain spaces
- » Cannot contain ;
- » Cannot contain A–Z
- » Cannot start with xml

Stick to a–z & 0–9, with – & . as separators

```

What about attribute *values*?

Attribute values are always *strings*, but you can categorize those strings as well:

1. Pre-defined
2. Open-ended
3. Boolean
4. Custom

# Pre-Defined Attribute Values

Some values are pre-defined by the HTML spec

`<ol>`'s `type` attribute supports only these values: `1`, `a`, `A`, `i`, & `I`

However, `<ol>`'s `start` attribute supports a range of any integer as a value, like `-1000`, `1`, or `1000`

In both cases, those are the only values allowed for those attributes

# Open-Ended Attribute Values

Instead of a pre-defined list of values or a range of values, open-ended values can be almost anything you want

`<o1>`'s global attribute `title` can have almost any UTF-8 character you want in the value (with certain restrictions)

`title="The Call of Cthulhu was published in 1928"` & `title="The 📞 of 🐙 was 📖 in 1928"` are both valid

# Boolean Attribute Values

`<ol>`'s `reversed` attribute is a *boolean attribute*

A boolean attribute is *true* if any of these are true:

- » It's present: `<ol ... reversed>`
- » It's value is an empty string: `<ol ... reversed="">`
- » It's value matches the attribute: `<ol ... reversed="reversed">`

A boolean attribute is *false* if it doesn't appear at all

```
1 <p>
2   All these are equivalent:
3 </p>
4
5 <p>
6   <label><input
7     type="checkbox" checked
8     name="Cthulhu" required>
9     Cthulhu</label>
10 </p>
11 <p>
12   <label><input
13     type="checkbox" checked="checked"
14     name="Cthulhu"
15     required="required">
16     Cthulhu</label>
17 </p>
18 <p>
19   <label><input
20     type="checkbox" checked=""
21     name="Cthulhu" required="">
22     Cthulhu</label>
23 </p>
```

All these are equivalent:

- Cthulhu
- Cthulhu
- Cthulhu

allowfull- screen	checked controls	multiple muted
allowpayment- request	defer disabled	novalidate playsinline
allowusermedia	formnovalidate	readonly
async	hidden	required
autofocus	ismap	selected
autoplay	itemscope	true-speed
capture	loop	typemustmatch

Some of the boolean attributes used in HTML

# Custom Attribute Values

Custom attributes of course require you to create a custom syntax for that attribute's value

What values does the custom attribute `foo` allow for?

How are those values expressed & used?

WebSanity's custom attribute `data-display` has used these values & more:

- » `data-display="amount_option == 'other..'"`
- » `data-display="( (member_status == 'member' || member_status == 'member_spcl') || employment_status != '' || new_membership == 'No Membership' )"`
- » `data-display="(employment_status == 'Full-time' || employment_status == 'Part-time')"`

## SIDE NOTE

Some attributes can contain multiple values — in `class="foo bar"`, `foo` & `bar` are separate values

`class="foo" class="bar"` is *not* allowed because you cannot repeat attributes in a tag, so instead you combine the values together as `class="foo bar"`

Other attributes have single values that contain strings with spaces in them — in `title="The Call of Cthulhu"`, that value is a phrase that is taken as a whole

As we dive further into HTML elements, let's start big & go smaller, i.e.: sectioning to grouping to text semantics

# Sectioning

## Creates section

`<body>`

`<nav>`

`<article>`

`<aside>`

`<section>`

`<h1>–<h6>*`

## Section info

`<h1>–<h6>`

`<header>`

`<footer>`

`<address>`

`<hgroup>`

\* Can create *implicit*, not explicit, section

💡 PRO TIP

Sectioning elements are the main semantic structural elements

There was an idea when HTML5 was introduced that these elements would be used by browsers to create an outline for visitors to use for in-page navigation

This didn't happen (too complex & messy!) & probably will never happen

Rely on heading elements, `<h1>`—`<h6>`

`<nav> ... </nav>`

A section of a page with *navigation links* to...

- » Other pages, either internal or external, or
- » Parts within the page (URL fragments), like a table of contents

Only “major navigation blocks”

More than one `<nav>` section is OK on a page

```
HTML
1 <h2>&lt;nav> without CSS</h2>
2
3 <nav>
4   <ul>
5     <li><a href="#">Life</a></li>
6     <li><a href="#">Writings</a></li>
7     <li><a href="#">Characters</a></li>
8     <li><a href="#">Influence</a></li>
9     <li><a href="#">Contact</a></li>
10  </ul>
11 </nav>
```

## <nav> without CSS

- [Life](#)
- [Writings](#)
- [Characters](#)
- [Influence](#)
- [Contact](#)

## <nav> with CSS

```
CSS
JS
```

## HTML

```
12
13 <h2>&lt;nav> with CSS</h2>
14
15 <nav class="styled">
16   <ul>
17     <li><a href="#">Life</a></li>
18     <li><a href="#">Writings</a></li>
19     <li><a href="#">Characters</a></li>
20     <li><a href="#">Influence</a></li>
21     <li><a href="#">Contact</a></li>
22   </ul>
23 </nav>
```

## CSS

```
1 nav.styled ul {
2   margin: 0;
3   padding: 0;
4   list-style: none;
5 }
6
7 nav.styled ul li {
8   float: left;
9   display: block;
10  background: #4B4B4B;
```

## JS

# <nav> without CSS

- [Life](#)
- [Writings](#)
- [Characters](#)
- [Influence](#)
- [Contact](#)

# <nav> with CSS

```
<article> ... </article>
```

A section of content that can *stand on its own as a complete & self-contained composition* that could be independently distributed or reused

Services & software use `<article>` to gather important content from a webpage, e.g.:

- » Scrapers like Diffbot & Mercury Web Parser
- » Read-it-later services like Instapaper & Pocket
- » Browser add-ons like Mercury Reader & Reader Mode
- » Built-in browser tools like Safari Reader, Firefox Reader View, & Edge's Immersive Reader

Though H. P. Lovecraft was not widely appreciated during his prolific but brief writing career in the early 1900s, his love for and connection to his Rhode Island hometown were near absolute. His stock has risen dramatically in the worlds of horror and science fiction literature in recent years, and so has his place as a local hero.

When I moved to Providence not long ago, I was drawn to learn more about Lovecraft. It proved a fateful decision, because to know Lovecraft turns out to be a way to know a great deal about the city.

Last year was the 125th anniversary of his birth and it's clear that Lovecraft is more studied and more hip than ever, certainly far more than during his relatively

There were all sorts of rumours about how Marsh had come to look. He had once been a great dandy, and people said he still wore the frock-coated finery of the Edwardian age, curiously adapted to certain deformities.

## CSS

## JS

As for business—the abundance of fish was certainly almost uncanny, but the natives were taking less and less advantage of it. Moreover, prices were falling and competition was growing. Of course the town's real business was the refinery, whose commercial office was on the square only a few doors east of where we stood. Old Man Marsh was never seen, but sometimes went to the works in a closed, curtained car.

---

*There were all sorts of rumours about how Marsh had come to look.*

---

There were all sorts of rumours about how Marsh had come to look. He had once been a great dandy, and people said he still wore the frock-coated finery of the Edwardian age, curiously adapted to certain deformities. His sons had formerly conducted the office in the square, but latterly they had been keeping out of sight a good deal and leaving the brunt of affairs to the younger generation. The sons and their sisters had come to look very queer, especially the elder ones; and it was said that their health was failing.

13      in its malign suggestiveness."</p>
14   </section>
15   <section>
16     <h2>Nyarlathotep</h2>
17     <p>"And it was then that
18      Nyarlathotep came out of Egypt.
19      Who he was, none could tell, but
20      he was of the old native blood and
21      looked like a Pharaoh."</p>
22   </section>
23 </article>
```

# Cthulhu Mythos

The Cthulhu Mythos is a shared fictional universe, based on the work of American horror writer H. P. Lovecraft.

## Yog-Sothoth

"Imagination called up the shocking form of fabulous Yog-Sothoth—only a congeries of iridescent globes, yet stupendous in its malign suggestiveness."

## Nyarlathotep

"And it was then that Nyarlathotep came out of Egypt. Who he was, none could tell, but he was of the old native blood and looked like a Pharaoh."

Don't get `<section>`-itis!

Only use `<section>` there's a layout or other presentational purpose

`<body>` is the *root section container*

It's common to put a `<header>`, `<h1>`, or `<footer>` directly inside `<body>`

You can—and should!—still use `<header>`, `<h1>`, or `<footer>` inside other sectioning elements like `<aside>`

<h1> ... </h1>

<h2> ... </h2>

<h3> ... </h3>

<h4> ... </h4>

<h5> ... </h5>

<h6> ... </h6>

*Headings*, from biggest (most important) to smallest (least important)

4 <h4>Heading 4</h4>
5 <h5>Heading 5</h5>
6 <h6>Heading 6</h6>
7 <p>Paragraph</p>
```

# Heading 1

## Heading 2

### Heading 3

#### Heading 4

##### Heading 5

###### Heading 6

Paragraph

`<h1>`

*Title of the webpage for humans to see*

`<h1>` often shares some of the same text as in `<title>`

Use it only once per page (usually)

`<h2>`

Generally used as the most important label in a non-  
`<body>` section

<h4>

By default, the same font size as <p>

Use as many headers per page as you'd like

Search engines give text inside headers extra weight,  
so use good keywords

The first heading in a section *labels* that section

Any other heading *creates an implicit section* & also *labels* that implicit section

Principles of  
Corporate Finance

TENTH EDITION

## 1-3 Goals of the Corporation

**Shareholders Want Managers to Maximize Market Value**

Wal-Mart has over 300,000 shareholders. There is no way that Wal-Mart's shareholders can be actively involved in management; it would be like trying to run New York City by town meetings. Authority has to be delegated to professional managers. But how can Wal-Mart's managers make decisions that satisfy all the shareholders? No two shareholders are exactly the same. They differ in age, tastes, wealth, time horizon, risk tolerance, and investment strategy. Delegating the operation of the firm to professional managers can work only if the shareholders have a common objective. Fortunately there is a natural financial objective on which almost all shareholders agree: Maximize the current market value of shareholders' investment in the firm.

A smart and effective manager makes decisions that increase the current value of the company's shares and the wealth of its stockholders. This increased wealth can then be put to whatever purposes the shareholders want. They can give their money to charity or spend it in glitzy nightclubs; they can save it or spend it now. Whatever their personal tastes or objectives, they can all do more when their shares are worth more.

Maximizing shareholder wealth is a sensible goal when the shareholders have access to well-functioning financial markets.<sup>6</sup> Financial markets allow them to share risks and transport savings across time. Financial markets give them the flexibility to manage their own savings and investment plans, leaving the corporation's financial managers with only one task: to increase market value.

A corporation's roster of shareholders usually includes both risk-averse and risk-tolerant investors. You might expect the risk-averse to say, "Sure, maximize value, but don't touch too many high-risk projects." Instead, they say, "Risky projects are OK, *provided* that expected profits are more than enough to offset the risks. If this firm ends up too risky for my taste, I'll adjust my investment portfolio to make it safer." For example, the risk-averse shareholders can shift more of their portfolios to safe assets, such as U.S. government bonds. They can also just say good-bye, selling shares of the risky firm and buying shares in a safer one. If the risky investments increase market value, the departing shareholders are better off than if the risky investments were turned down.

**A Fundamental Result**

The goal of maximizing shareholder value is widely accepted in both theory and practice. It's important to understand why. Let's walk through the argument step by step, assuming that the financial manager should act in the interests of the firm's owners, its stockholders.

1. Each stockholder wants three things:
  - a. To be as rich as possible, that is, to maximize his or her current wealth.
  - b. To transform that wealth into the most desirable time pattern of consumption either by borrowing to spend now or investing to spend later.
  - c. To manage the risk characteristics of that consumption plan.
2. But stockholders do not need the financial manager's help to achieve the best time pattern of consumption. They can do that on their own, provided they have free

<sup>6</sup> Here we use "financial markets" as shorthand for the financial sector of the economy. Strictly speaking, we should say "access to well-functioning financial markets and institutions." Many investors deal mostly with financial institutions, for example, banks, insurance companies, or mutual funds. The financial institutions then engage in financial markets, including the stock and bond markets. The institutions act as financial intermediaries on behalf of individual investors.

```
<h4>The Call of Cthulhu</h4>
```

```
<header> ... </header>
```

*Introductory or navigational aids* for a section

Does not create a new section; it labels a section

Multiple `<header>`s are fine in a webpage, up to one per section

- » One at the top of the webpage (in `<body>`)
- » One at the top of sections (as appropriate)

Every section does not need a `<header>` (though you may want one)

Use `<header>` when you need something more complex than just a heading like `<h2>`

A typical `<header>` may contain...

- » A section's heading (`<h1>`-`<h6>`)
- » Table of contents
- » Logos
- » Navigation (likely in `<nav>`)
- » Search form

```
HTML
1 <header>

```

The higher sky, as we crossed the range, was surely vaporous and disturbed enough; and although I did not see the zenith I can well imagine that its swirls of ice-dust may have taken strange forms. Imagination, knowing how vividly distant scenes can sometimes be reflected, refracted, and magnified by such layers of restless cloud, might easily have supplied the rest—and of course Danforth did not hint any of those specific horrors till after his memory had had a chance to draw on his bygone reading. He could never have seen so much in one instantaneous glance.

At the time his shrieks were confined to the repetition of a single mad word of all too obvious source:

*“Tekeli-li! Tekeli-li!”*

19 </address>
```

But he did not faint, and that man of unholy centuries and forbidden secrets never troubled the world again. The madness out of time had subsided, and the case of Charles Dexter Ward was closed. Opening his eyes before staggering out of that room of horror, Dr. Willett saw that what he had kept in memory had not been kept amiss. There had, as he had predicted, been no need for acids. For like his accursed picture a year before, Joseph Curwen now lay scattered on the floor as a thin coating of fine bluish-grey dust.

</address>
```

`<hgroup> ... </hgroup>`

*Combines two headings together* into one item for outlining

Added in HTML5 & then removed in the W3C spec (but still in the WHATWG spec)

Outlining via sectioning is dead, so don't use `<hgroup>` (& there are better solutions anyway, coming right up)

“h1–h6 elements must not be used to markup subheadings, subtitles, alternative titles and taglines unless intended to be the heading for a new section or subsection.” —W3C

So how do you indicate subtitles without `<hgroup>`?

W3C provides 4 ways to solve the subtitle problem

1. `<hgroup>` 🙅
2. Use `<header>`
3. Use a `:` or `-` or another appropriate character
4. Nest other HTML inside the heading

```
<hgroup>  
  <h2>Nyarlathotep</h2>  
  <h3>Stalker among the Stars</h3>  
</hgroup>
```

As we said, `<hgroup>` can confuse parsers, so this is not advised

Use `<header>`:

```
<section>  
  <header>  
    <h2>Nyarlahotep</h2>  
    <p>Stalker among the Stars</p>  
  </header>  
</section>
```

Too verbose & complex, & still requires understanding the outlining algorithm (which nothing does)

Why `<section>`? Because if this is in the middle of an `<article>`, what else would be semantically appropriate?

Use a character to separate title & subtitle:

```
<h2>
```

Nyarlahotep: Stalker among the Stars

```
</h2>
```

This is pretty good & is widely used, but it doesn't fit every circumstance

Nest other elements inside the heading:

```
<h2>  
  Nyarlathotep  
  <small>Stalker among the Stars</small>  
</h2>
```

More on this when we get to `<small>` in Text Semantics

				ios		
<code>&lt;nav&gt;</code>	9	4	4.1	4.2	5	Y
<code>&lt;article&gt;</code>	9	4	4.1	4.2	5	Y
<code>&lt;aside&gt;</code>	9	4	4.1	4.2	5	Y
<code>&lt;section&gt;</code>	9	4	4.1	4.2	5	Y
<code>&lt;header&gt;</code>	9	4	4.1	4.2	5	Y
<code>&lt;footer&gt;</code>	9	4	4.1	4.2	5	Y
<code>&lt;hgroup&gt;</code>	9	4	5	4.2	5	2.2

Grouping

Grouping elements go inside sectioning elements like  
`<section>`, `<article>`, & `<aside>`

They group content *inside* sectioning elements, but do not *create* sections

<p>

<hr>

<blockquote>

<figure> & <figcaption>

<pre>

<main>

## SIDE NOTE

These grouping elements are covered elsewhere

Lists: `<li>`, `<ul>`, `<ol>`, `<menu>`, `<dl>`, `<dt>`, `<dd>`

CSS Hooks: `<div>`

<p> ... </p>

## *Paragraph*

Very common element!

Built-in browser styles...

- » Insert top & bottom margins
- » Do not indent
- » Use ragged right margin

## From H. P. Lovecraft's "Dagon"

Lovecraft describes an eerie landscape that appears overnight:

Through some unprecedented volcanic upheaval, a portion of the ocean floor must have been thrown to the surface, exposing regions which for innumerable millions of years had lain hidden under unfathomable watery depths. ...

For several hours I sat thinking or brooding in the boat, which lay upon its side and afforded a slight shade as the sun moved across the heavens. As the day progressed, the ground lost some of its stickiness, and seemed likely to dry sufficiently for travelling purposes in a short time.

Principles of  
Corporate Finance

TENTH EDITION

## 2-1 Future Values and Present Values

## Calculating Future Values

Money can be invested to earn interest. So, if you are offered the choice between \$100 today and \$100 next year, you naturally take the money now to get a year's interest. Financial managers make the same point when they say that money has a *time value* or when they quote the most basic principle of finance: *a dollar today is worth more than a dollar tomorrow*.

Suppose you invest \$100 in a bank account that pays interest of  $r = 7\%$  a year. In the first year you will earn interest of  $.07 \times \$100 = \$7$  and the value of your investment will grow to \$107:

$$\text{Value of investment after 1 year} = \$100 \times (1 + r) = 100 \times 1.07 = \$107$$

By investing, you give up the opportunity to spend \$100 today and you gain the chance to spend \$107 next year.

If you leave your money in the bank for a second year, you earn interest of  $.07 \times \$107 = \$7.49$  and your investment will grow to \$114.49:

$$\text{Value of investment after 2 years} = \$107 \times 1.07 = \$100 \times 1.07^2 = \$114.49$$

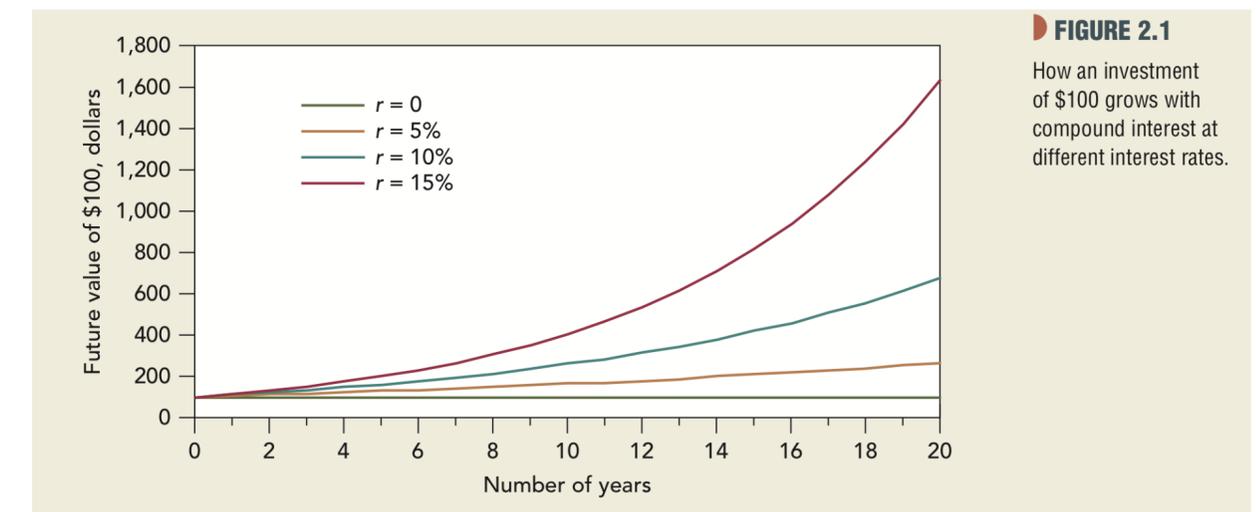

| Today | Year 2          |
|-------|-----------------|
| \$100 | \$114.49        |
|       | $\times 1.07^2$ |

Notice that in the second year you earn interest on both your initial investment (\$100) and the previous year's interest (\$7). Thus your wealth grows at a *compound rate* and the interest that you earn is called **compound interest**.

If you invest your \$100 for  $t$  years, your investment will continue to grow at a 7% compound rate to  $\$100 \times (1.07)^t$ . For any interest rate  $r$ , the future value of your \$100 investment will be

$$\text{Future value of } \$100 = \$100 \times (1 + r)^t$$

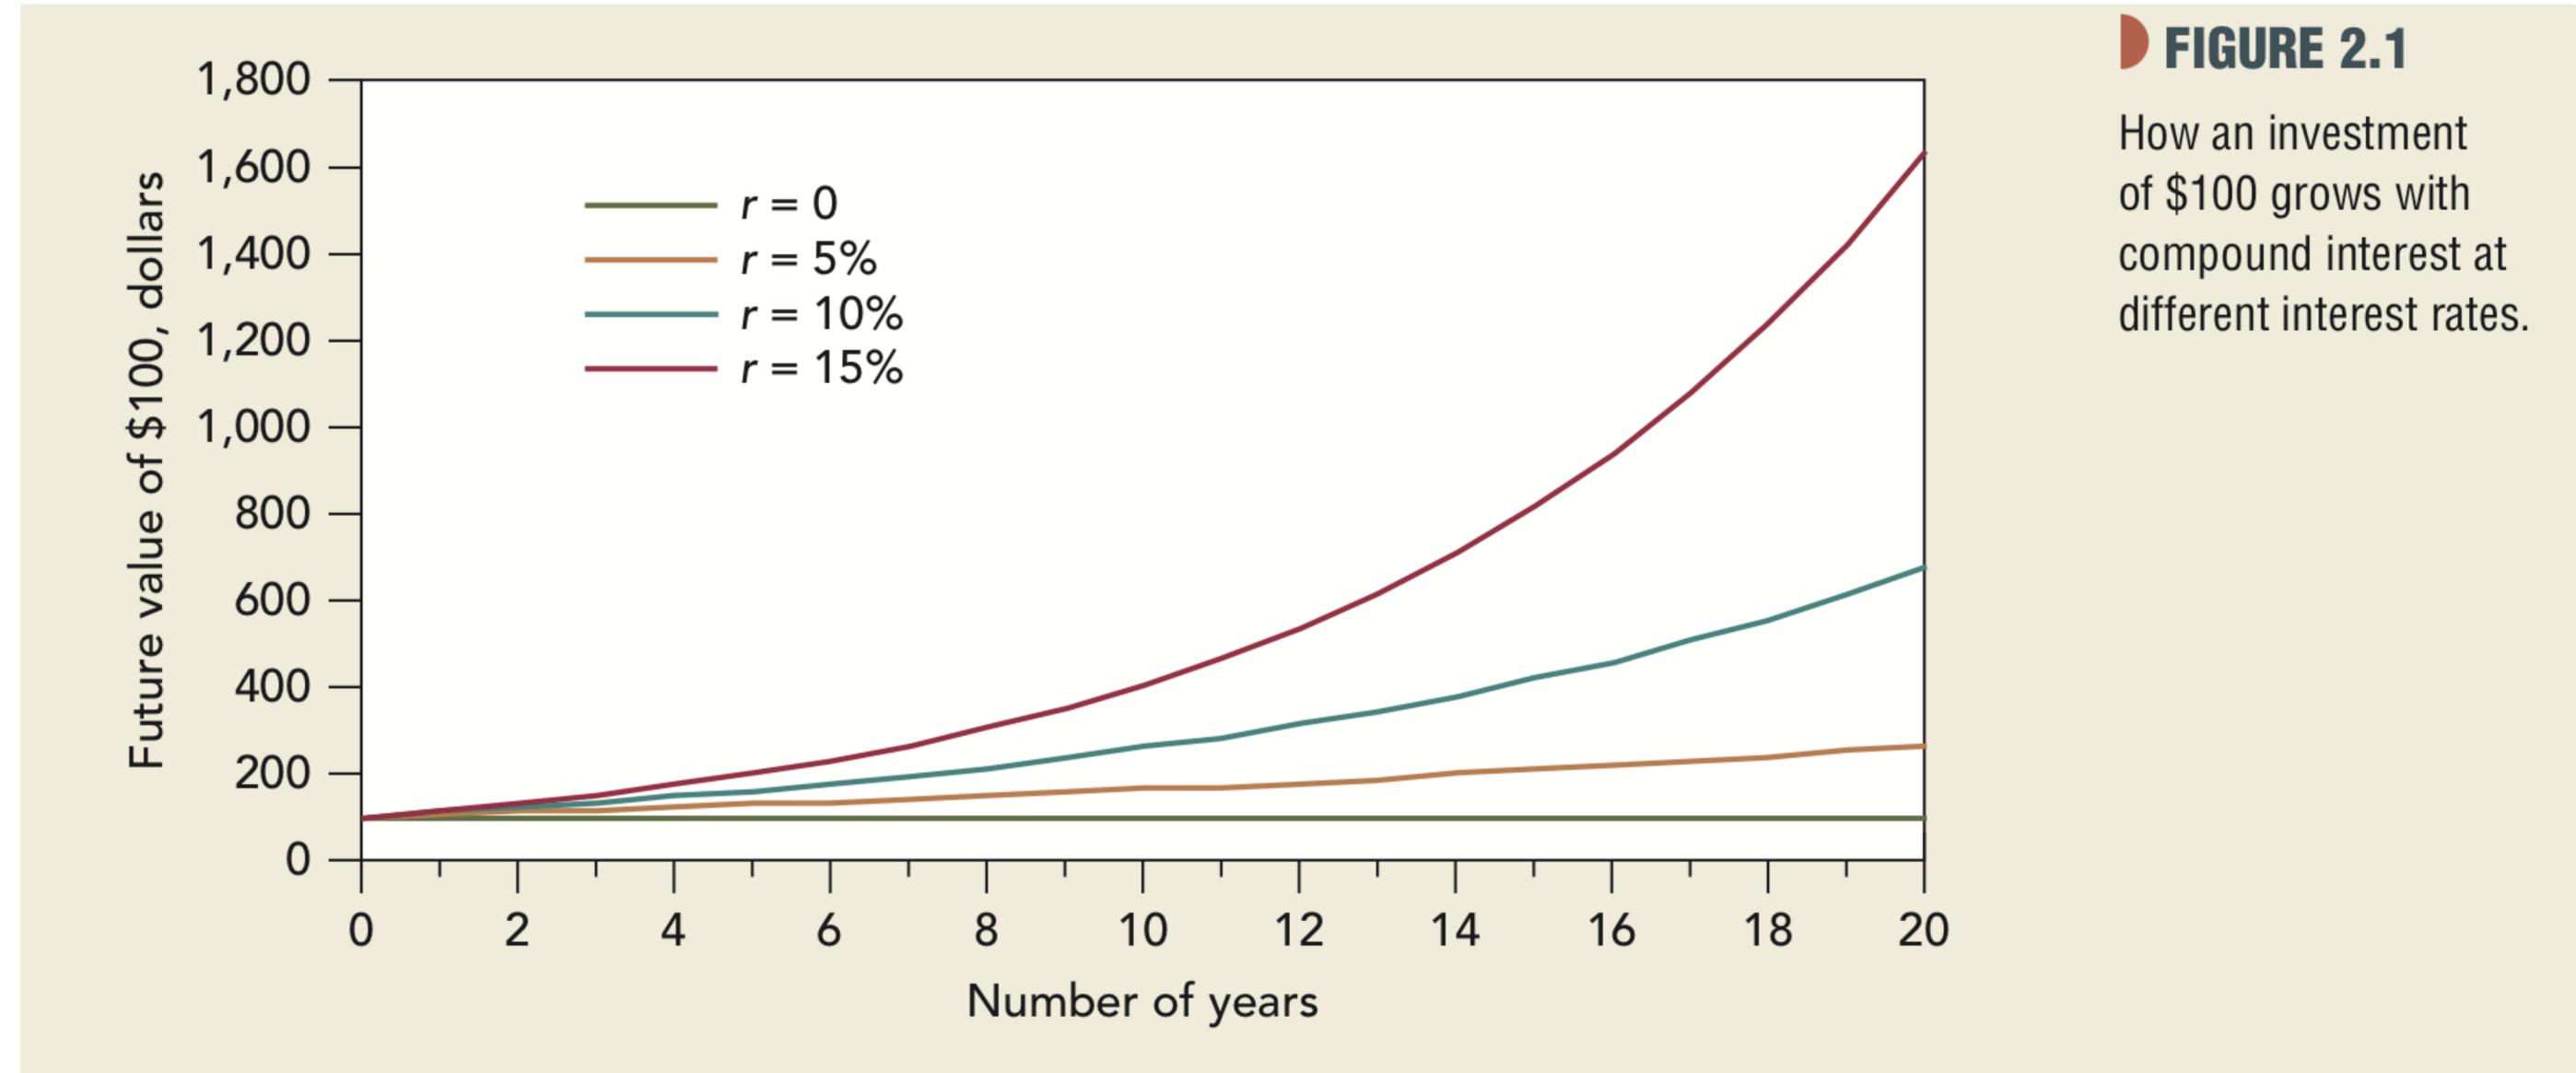

The higher the interest rate, the faster your savings will grow. Figure 2.1 shows that a few percentage points added to the interest rate can do wonders for your future wealth. For example, by the end of 20 years \$100 invested at 10% will grow to  $\$100 \times (1.10)^{20} = \$672.75$ . If it is invested at 5%, it will grow to only  $\$100 \times (1.05)^{20} = \$265.33$ .

found rate to \$100  $(1+r)^t$ . For any interest rate  $r$ , the future value of your \$100 investment will be

$$\text{Future value of } \$100 = \$100 \times (1 + r)^t$$

The higher the interest rate, the faster your savings will grow. Figure 2.1 shows that a few percentage points added to the interest rate can do wonders for your future wealth. For example, by the end of 20 years \$100 invested at 10% will grow to  $\$100 \times (1.10)^{20} = \$672.75$ . If it is invested at 5%, it will grow to only  $\$100 \times (1.05)^{20} = \$265.33$ .

Referred to in main content, but could be moved elsewhere, to...

- » Sidebar
- » Dedicated page
- » Appendix

If it is tangentially related, it should be in an `<aside>`,  
not `<figure>`

`<figcaption>`

Optional *caption or legend* associated with a `<figure>`

Can be first *or* last element inside `<figure>`

## HTML

```
1 <p>
2   My dog Libby was a wonderful dog, & very cute,
   as you can see:
3 </p>
4
5 <figure>
6   
7   <figcaption>
8     Libby when she was a few months old
9   </figcaption>
10 </figure>
```

## CSS

## JS

My dog Libby was a wonderful dog, & very cute, as you can see:

Libby when she was a few months old

Do not use `<figure>` unless it is referenced in the text

```
<p>
```

```
    Cthulhu's followers speak a near-unintelligible  
chant, as shown in Figure 1.
```

```
</p>
```

```
<figure>
```

```
    Ph'nglui mglw'nafh Cthulhu R'lyeh wgah'nagl  
fhtagn!
```

```
    <figcaption>
```

```
        Figure 1: Cthulhu cultists' chant.
```

```
    </figcaption>
```

```
</figure>
```

```
<figure>
  
</figure>
```

Images can go inside `<figure>`, but *do not automatically put every image in a `<figure>`* (unless it is referenced in the text)

```
<p>
  ...as you can see in Figure 3.
```

```
<p>
<figure>
  
</figure>
```

# FORMATTING GUIDE

```
<p>  
  <figure>  
  </figure>  
</p>
```

Never surround `<figure>` with `<p>`

---

```
<figure>  
  hp@lovecraft.com  
</figure>
```

## SIDE NOTE

How do you put a caption on an image that is not a  
`<figure>`?

## HTML

```
1 <p>
2   Among the dogs in my life, I've been lucky
   enough to have the companionship of Alex, Libby,
   Buddy, & Dobie.
3 </p>
4
5 <p>
6   
7   <br><i>Libby when she was a few months old</i>
8 </p>
```

Among the dogs in my life, I've been lucky enough to have the companionship of Alex, Libby, Buddy, & Dobie.

*Libby when she was a few months old*

## CSS

## JS

How rendering engines display white space

The rule: *multiple white spaces are rendered as 1 space*

Type 100 spaces? Browser shows 1 space

Type 100 tabs? Browser shows 1 space

Type 100 returns? Browser shows 1 space

With 1 exception ...

<pre> ... </pre>

*Preformatted text* that relies on typography for meaning

- » White space is respected: 5 spaces rendered with 5 spaces
- » Browsers use a monospace font for text
- » Automatic word wrap disabled

Uses for `<pre>`:

- » Code (normally wrapped in `<code>`)
- » ASCII art
- » Embedded email
- » Poetry

```
1 <h2>From "[in Just-]", by e. e. cummings</h2>
2
3 <pre>
4 it's
5 spring
6 and
7     the
8         goat-footed
9
10 baloonMan    whistles
11 far
12 and
13 wee
14 </pre>
```

## From "[in Just-]", by e. e. cummings

```
it's
spring
and
    the
        goat-footed
baloonMan    whistles
far
and
wee
```

I immediately began to worry when I felt like I was climbing down a ladder the further I walked away from Moe & Grace's. Soon I realized that instead of climbing down a ladder, I was in fact descending into the pits of Hell, and TJ was Satan himself, the tormentor, the evil one, intent on torturing us all until we were left broken shells of humanity, weak and unable to continue any longer.

We walked. "We're almost there!", TJ would proclaim confidently. Minutes would pass, as we would walk up and then down and then up and then up and then up a hill. "Oh wait," TJ would softly whisper, hoping we didn't hear him, "No, we need to go over here." More climbing ...

as  
we  
walked  
up  
the  
steepest  
hills  
in  
the  
entire  
world  
and  
then  
back  
down  
again  
and  
then  
up  
back  
up ...  
and

"We're almost there!", TJ would again announce, and what was the worst thing is that we would believe him. We would believe him! "OK, TJ! OK!", we would all puff, following along like brainwashed prisoners in a new Bataan Death March. And then the whole process would begin again. "Oh, hmmm, it's not here ...", TJ would mutter. Soon it became obvious that TJ was just trying to destroy us as part of a sick game that only he could truly comprehend. And I was so glad I was wearing pants on what was perhaps the warmest night in San Francisco's history. I loved the hot feeling of stickiness on my legs as the sweat melted my jeans to my thighs. And then we finally made it! We made it! The bar was ahead! We were saved! YES!

# FORMATTING GUIDE

`<br>` can go at the beginning or  
end of a line

I prefer it at the beginning so  
it's easier to see when scanning  
down through code

Warning!

Never use 2 `<br>` consecutively to create a fake paragraph, as it complicates styling with CSS!

```
HTML
1 <p>
2   "Fifteen year' gone," he rambled,
   "I heered Ol' Whateley say as haow
   some day we'd hear a child o'
   Lavinny's a-callin' its father's
   name on the top o' Sentinel Hill..."
3 </p>
4 <p>
5   But Joe Osborn interrupted him to
   question the Arkham men anew.
6   <br>
7   <br>"What was it, anyhaow, an'
   haowever did young Wizard Whateley
   call it aout o' the air it come
   from?"
8 </p>
9 <p>
10  Armitage chose his words very
```

```
CSS (SCSS)
1 p {

Facts Concerning  
the Late Arthur  
Jermyn and His  
Family

Facts Concerning  
the Late Arthur  
Jermyn  
and His Family

## PRO TIP

For poetry, you should use the following CSS in case of longer lines rendered on smaller screens

```
.poetry > span {  
  text-indent: -1em;  
  display: inline-block;  
  margin-left: 1em;  
}
```

```
HTML
4
5 <p class="poetry">
6   <span>I sing the body electric,
  </span>
7   <br><span>The armies of those I love
  engirth me and I engirth them,</span>
8   <br><span>They will not let me off
  till I go with them, respond to
  them,</span>
9   <br><span>And discorrupt them, and
  charge them full with the charge of the
```

```
CSS (SCSS)
1 .poetry > span {
2   /* Pulls 1st line to left */
3   text-indent: -1em;
4   /* Allows margin-left to work on inline
  elements */
5   /* Still need <br> so copying & pasting
  works correctly */
6   display: inline-block;
7   /* Wrapped lines are "indented" */
8   margin-left: 1em;
9 }
```

```
JS
```

# I Sing the Body Electric

## by Walt Whitman

1

I sing the body electric,  
The armies of those I love engirth me and I engirth  
them,  
They will not let me off till I go with them, respond to  
them,  
And discorrupt them, and charge them full with the  
charge of the soul.

Was it doubted that those who corrupt their own  
bodies conceal themselves?  
And if those who defile the living are as bad as they  
who defile the dead?

# FORMATTING GUIDE

```
<p>
```

```
  <br>Better yet, if called by a panther,  
  <br>Don't anther.
```

```
</p>
```

Never have a `<br>` as the first thing in any element

---

```
<p>
```

```
  Better yet, if called by a panther,  
  <br>Don't anther.
```

```
</p>
```

# FORMATTING GUIDE

```

```
</p>
```

```
<ul>
```

`<wbr>`

*Word break opportunity*: place(s) where rendering engines may optionally break lines of text, even where they might not otherwise create breaks

When using `<wbr>` with URLs, insert `<wbr>` *before* punctuation

This avoids leaving punctuation marks at the ends of lines

```
1 <p>  
2  
   http://www<wbr>.granneman<wbr>.com<wbr>/teaching<  
   wbr>/cait<wbr>-center<wbr>-application<wbr>-  
   information<wbr>-technology<wbr>/mastering<wbr>-  
   effective<wbr>-web<wbr>-design/  
3 </p>
```

<http://www.granneman.com/teaching/cait-center-application-information-technology/mastering-effective-web-design/>

`<wbr>` does not automatically insert hyphens at the break

Use the *soft hyphen* character entity (`&shy;`), which inserts a hyphen only at a break, after the `<wbr>`

```
1 <p>
2   One of my favorite songs from <i>Mary
   Poppins</i> is
   Supercali<wbr>fragilistic<wbr>expiali<wbr>doci
   ous.
3 </p>
4
5 <!-- Use the soft hyphen to insert a hyphen at
   the break -->
6 <p>
7   One of my favorite songs from <i>Mary
   Poppins</i> is
   Supercali<wbr>&shy;fragilistic<wbr>&shy;expiali
   <wbr>&shy;docious.
8 </p>
```

One of my favorite songs from *Mary Poppins* is Supercali fragilisticexpialidocious.

One of my favorite songs from *Mary Poppins* is Supercali-fragilisticexpialidocious.

 PRO TIP

Can also automatically hyphenate with CSS properties  
`word-break` & `hyphens`

Emphasis

<em> & <strong>

<i> & <b>

<mark>

<s> & <del>

<u>

`<em> ... </em>`

Text that has *stress emphasis* (that's stress as in *prominence*, not as in emotions)

Always italicized by browsers, but that's not in the spec

```
1 <p>
2   Who's going to eat you?
3   <em>Cthulhu</em> is going to eat you.
4 </p>
5 <p>
6   Am I really going to get eaten? Cthulhu
7   <em>is</em> going to eat you.
8 </p>
9 <p>
10  What's Cthulhu going to do to me?
11  Cthulhu is going to <em>eat</em> you.
12 </p>
13 <p>
14  Who's Cthulhu going to eat? Cthulhu is
15  going to eat <em>you</em>.
```

Who's going to eat you? *Cthulhu* is going to eat you.

Am I really going to get eaten? Cthulhu *is* going to eat you.

What's Cthulhu going to do to me? Cthulhu is going to *eat* you.

Who's Cthulhu going to eat? Cthulhu is going to eat *you*.

```
<strong> ... </strong>
```

*Strongly emphasized text*

Text that shows “strong importance, seriousness, or urgency”

Always bolded by built-in browser styles, but that’s not in the spec

```
1 <p>
2   <strong>Warning</strong>: Do not
   feed the bears.
3 </p>
4
5 <p>
6   Your papers are due no later than
   <strong>May 8</strong>.
7 </p>
8
9 <p>
10  Come here <strong>now</strong>.
11 </p>
```

**Warning:** Do not feed the bears.

Your papers are due no later than **May 8**.

Come here **now**.

<i> ... </i>

HTML 4: *Italicized text* (& deprecated!)

HTML5: “text in an *alternate voice* or mood, or ...  
indicating a different quality of text”

*Stylistically* italic

```
1 <h3>Taxonomic designation</h3>
2 <p>That, my friend, is a
  <i>Heterocephalus glaber</i>.</p>
3 <h3>Technical terms</h3>
4 <p>What you are experiencing is a
  <i>PEBKAC</i> error.</p>
5 <h3>Idiomatic phrase from another
  language</h3>
6 <p>"Listen, <i>boychick</i>," the
  Rabbi said, "you know
  <i>bupkes</i>."</p>
7 <h3>Transliteration</h3>
8 <p>Achilles is driven by κλέος (<i

I'm a link! Click me, by Cthulhu!

typewriter responds perfectly. Uneven touch and erratic rhythm will cause a perfectly adjusted machine to skip, pile, crowd, or shadow. A flimsy or uneven desk will create a vibration that may result in any of these difficulties in a perfectly adjusted machine. An improperly installed ribbon or ribbon spool will create ribbon trouble and dim or unevenly typed impressions. Too often, because of some of these defects of operation, a mechanic will attempt adjustments resulting in maladjusting the machine.

2. Purpose. It is the purpose of this manual to present proper methods of adjustment and repair for the benefit of all persons engaged in adjusting and repairing typewriters. Careful study of this manual will enable proper adjustments and repairs to be made with a minimum amount of time lost in such operations.

3. Method of presentation. Attempt has been made to consolidate into each situation section similar assemblies of all of the latest models of all makes of non-portable typewriters. As nearly as possible, the material is presented in order of adjustments to be made, so that adjustments, once made, will not be affected by subsequent adjustments to other assemblies. Sequence of Adjustments ( see page ) details the correct approach for adjusting each make of typewriter.

15
16 <p>
17   Add the following just before <code>&lt;/body></code>:
18 </p>
19
20 <pre>
21 <code class="language-html">
22 &lt;script>
23   $(document).ready(function() {
24     $(".fancybox").fancybox();
25   });
26 &lt;/script></code>
27 </pre>
```

## Good

Add the following just before </body>:

```
<script>
  $(document).ready(function() {
    $(".fancybox").fancybox();
  });
</script>
```

## Problems

Add the following just before </body>:

```
<script>
  $(document).ready(function() {
    $(".fancybox").fancybox();
  });
</script>
```

# Quotations

`<q> ... </q>`

For *short inline quotations*

Can include `cite` attribute that points to URL (not exposed to users, so for server-side processing only)

Can nest `<q>` within `<q>`

```
1 <h3>Single &lt;q></h3>
2
3 <p>
4   Then I thought with a shudder of what
   old Castro had told Legrasse about the
   primal Great Ones: <q>They had come
   from the stars, and had brought Their
   images with Them.</q>
5 </p>
6
7 <h3>Nested &lt;q></h3>
8
9 <p>
10  Lovecraft's narrator realizes the
   cosmic nature of the horror
   confronting him: <q>Then I thought
   with a shudder of what old Castro had
   told Legrasse about the primal Great
   Ones: <q>They had come from the stars,
   and had brought Their images with
   Them.</q></q>
11 </p>
```

## Single <q>

Then I thought with a shudder of what old Castro had told Legrasse about the primal Great Ones: “They had come from the stars, and had brought Their images with Them.”

## Nested <q>

Lovecraft's narrator realizes the cosmic nature of the horror confronting him: “Then I thought with a shudder of what old Castro had told Legrasse about the primal Great Ones: “They had come from the stars, and had brought Their images with Them.””

Quotation marks in different languages

WHATWG spec says: “The `q` element must not be used in place of quotation marks that do not represent quotes; for example, it is inappropriate to use the `q` element for marking up sarcastic statements.”

No air quotes!

Chris Farley on Saturday Night Live • March 19, 1994

# SIDE NOTE

Use hyphens & dashes correctly

Hyphen	-	Join words	Kareem Abdul-Jabbar Jay-Z Newly-formed group
En dash	–	Range	June–August 7–9 p.m.
Em dash	—	Parenthetical Inverted colon Interruption	Oh no—he thought—it’s her! Beer & brats—a great breakfast. I lo—no, I’ll say it later.
Minus	–	Math	$i^2 = -1$

-- or --- is *not* an en or em dash!

“Those who don’t know better might use two successive hyphens to indicate an em dash-like interruption. In her book, *Type Rules!*, Ilene Strizver describes this as a ‘typographically incorrect and downright ugly practice.’” —Kate Mooney

Hyphen	-	-	-
En dash	—	Apple: ⌘- ⌘: Alt+0150	&ndash;
Em dash	—	Apple: ⌘↑- ⌘: Alt+0151	&mdash;
Minus	-	Apple: ^⌘_ & search for “minus” ⌘: Alt+2212 (Really, just use a hyphen)	&minus;

Terms

<dfn>

<abbr>

<cite>

```
<dfn> ... </dfn>
```

A word or term that is *defined* ...

- » in the text around it, or
- » via the `title` attribute, which displays a tooltip when the user hovers over the term

Usually italicized by browsers

```
1 <p>
2   <dfn>Cthulhu</dfn> is a fictional cosmic
   entity that first appeared in the short story
   "The Call of Cthulhu", written by H. P.
   Lovecraft.
3 </p>
4
5 <p>
6   Some of the cosmic entities created by H. P.
   Lovecraft include <dfn title="A Great Old One
   that appears as a mix of a giant human, an
   octopus, and a dragon">Cthulhu</dfn>, <dfn
   title="A messenger of the Outer Gods who
   often appears as a tall, slim, joyous
   man">Nyarlathotep</dfn>, and <dfn title="An
   Elder God who appears as an elderly, human
   male with white hair">Nodens</dfn>.
7 </p>
```

*Cthulhu* is a fictional cosmic entity that first appeared in the short story “The Call of Cthulhu”, written by H. P. Lovecraft.

Some of the cosmic entities created by H. P. Lovecraft include *Cthulhu*, *Nyarlathotep*, and *Nodens*.

A Great Old One that appears as a mix of a giant human, an octopus, and a dragon

`<abbr> ... </abbr>`

A word or term that is *abbreviated* (shortened but used to represent the complete form) or is an *acronym*

May use `title` attribute to give the meaning

Some browsers display it with a dotted underline

```
1 <p>
2   One of the most influential horror
   writers in history is <abbr
   title="Howard Phillips">H. P.</abbr>
   Lovecraft.
3 </p>
```

One of the most influential horror writers in history is H. P. Lovecraft.

Howard Phillips

`<cite> ... </cite>`

HTML 4: *Citation* or reference to a creative work

HTML5: *Title* of a work

Most rendering engines italicize (fix that in CSS)

What things have titles? WHATWG's examples:

“... a book, a paper, an essay, a poem, a score, a song, a script, a film, a TV show, a game, a sculpture, a painting, a theatre production, a play, an opera, a musical, an exhibition, a legal case report, a computer program, etc”

```
HTML
1 <p>
2   H. P. Lovecraft wrote one of the
   most famous sentences in horror
   fiction, found in <cite>The Call of
   Cthulhu</cite>: “Ph’nglui mglw’nafh
   Cthulhu R’lyeh wgah’nagl fhtagn”.
3 </p>

CSS
JS
```

H. P. Lovecraft wrote one of the most famous sentences in horror fiction, found in *The Call of Cthulhu*: “Ph’nglui mglw’nafh Cthulhu R’lyeh wgah’nagl fhtagn”.

`<blockquote>` & `<q>` provide a `cite` attribute to reference online resources

`<cite>` & `cite` serve different purposes!

The content in the `<cite>` element is displayed by the browser; the value of the `cite` attribute is not

Yes, this is confusing...  $\_ (\text{ツ}) \_ /$

```
HTML
1 <p>H.P. Lovecraft describes an eerie
  landscape that appears overnight in “<cite
  class="short-story">Dagon</cite>”, found in
  his <cite>Collected Short Stories</cite>:</p>
2
3 <blockquote
  cite="http://www.hplovecraft.com/writings/texts/fiction/d.aspx">
4   <p>
5     Through some unprecedented volcanic
    upheaval, a portion of the ocean floor must
    have been thrown to the surface, exposing
    regions which for innumerable millions of
    years had lain hidden under unfathomable
    watery depths. ...
6   </p>
7   <p>
8     For several hours I sat thinking or

```

```
CSS
1 .short-story {
2   font-style: normal;
3 }
```

```
JS
```

H.P. Lovecraft describes an eerie landscape that appears overnight in “Dagon”, found in his *Collected Short Stories*:

Through some unprecedented volcanic upheaval, a portion of the ocean floor must have been thrown to the surface, exposing regions which for innumerable millions of years had lain hidden under unfathomable watery depths. ...

For several hours I sat thinking or brooding in the boat, which lay upon its side and afforded a slight shade as the sun moved across the heavens. As the day progressed, the ground lost some of its stickiness, and seemed likely to dry sufficiently for travelling purposes in a short time.

# CSS Hooks

<div>

<span>

```
<div> ... </div>
```

Generic container for adding a *division* (a *block box* or new object on the document tree) that can be manipulated with CSS & JavaScript

Should be used *only* if nothing semantic is appropriate

Does *nothing* on its own!

```
<span> ... </span>
```

Generic container for adding a *span* of text (an *inline box* or new object on the document tree) that can be manipulated with CSS & JavaScript

Should be used *only* if nothing semantic is appropriate

Does *nothing* on its own!

Lists

<li>

<ul> & <ol>

<menu>

<dl>, <dt>, <dd>

Unordered (Bulleted)	Ordered (Numbered)	Description (Definition)
<ul style="list-style-type: none"> <li>• Fee</li> <li>• Fie</li> <li>• Fo</li> <li>• Fum</li> </ul>	<ol style="list-style-type: none"> <li>1. Alien</li> <li>2. Aliens</li> <li>3. Alien<sup>3</sup></li> </ol>	<p>Lovecraft  Cthulhu  Burroughs  Tarzan  Dent  Doc Savage</p>

3 types of lists

	Type of List		
	Unordered	Ordered	Description
Main Element	<code>&lt;ul&gt;</code>	<code>&lt;ol&gt;</code>	<code>&lt;dl&gt;</code>
List Item Element	<code>&lt;li&gt;</code>	<code>&lt;li&gt;</code>	<code>&lt;dt&gt;</code> & <code>&lt;dd&gt;</code>

```
<li> ... </li>
```

*List items* in both unordered & ordered lists

Can be inside either `<ul>` or `<ol>`

*Do not* use on its own!

```
HTML
1 <p>
2   Great Old Ones in the Cthulhu
3   Mythos:
4 </p>
5 <ul>
6   <li>Cthulhu</li>
7   <li>Cthugha</li>
8   <li>Cyäegha</li>
9 </ul>
10 <p>
11   Great Old Ones in the Cthulhu
12   Mythos, ranked:
13 </p>
14 <ol>
15   <li>Cthulhu</li>
16   <li>Cthugha</li>
17   <li>Cyäegha</li>
18 </ol>
```

```
CSS
```

```
JS
```

Great Old Ones in the Cthulhu Mythos:

- Cthulhu
- Cthugha
- Cyäegha

Great Old Ones in the Cthulhu Mythos, ranked:

1. Cthulhu
2. Cthugha
3. Cyäegha

# FORMATTING GUIDE

```
<li>  
  The Call of Cthulhu  
</li>
```

Normally I put `<li>` on 1 line, but you don't have to (if you don't, 8 `<li>`s take up 24 lines in your code!)

---

```
<li>The Call of Cthulhu</li>
```

```
<ul> ... </ul>
```

*Unordered list*

Item order doesn't matter

Usually displayed with a solid bullet •, with sub-lists using other symbols ◦ ■ (all controllable via CSS)

```
1 <p>
2   The Great Old Ones in the Cthulhu
   Mythos:
3 </p>
4 <ul>
5   <li>Cthugha</li>
6   <li>Cthulhu</li>
7   <li>Cyäegha</li>
8   <li>Ghatanothoa</li>
9   <li>Hastur</li>
10  <li>Ithaqua</li>
11  <li>Tsathoggua</li>
12 </ul>
```

## The Great Old Ones in the Cthulhu Mythos:

- Cthugha
- Cthulhu
- Cyäegha
- Ghatanothoa
- Hastur
- Ithaqua
- Tsathoggua

`<ol> ... </ol>`

*Ordered list*

Item order matters

Usually displayed with Arabic numbers (1.), but can use other numbering `01 I i A a` (all controllable via CSS)

```
1 <p>
2   The Underpants Gnomes' 3-part business
3   plan:
4 </p>
5 <ol>
6   <li>Collect Underpants</li>
7   <li>??</li>
8   <li>Profit!</li>
9 </ol>
```

The Underpants Gnomes' 3-part business plan:

1. Collect Underpants
2. ???
3. Profit!

## Attributes

- » **type**: numbering type (**1**, **A**, **a**, **I**, **i**), but only use with technical or legal document (use CSS instead)
- » **start**: start value for numbering `<li>`s, but value is always an Arabic numeral (**start="3"**, even if **III** or **c** is used)
- » **reversed**: `<li>`s are numbered in reverse order

					iOS		
reversed	—	79	18	6.1	6	20	4.4

`<ol>` is often used to create navigation via CSS

Why? Because the order of navigation matters

```
HTML Tidy X
1 <nav>
2   <ol class="crumbs">
3     <li><a href="#">Home</a></li>
4     <li><a href="#">Lovecraft</a></li>
5     <li><a href="#">Great Old Ones</a></li>
6     <li><a href="#">Cthulhu</a></li>
7   </ol>
8 </nav>
9
```

```
CSS Tidy X
11 .crumbs li {
12   display: inline-block;
13 }
14
15 .crumbs li::after {
16   content: '>';
17   padding: 0 0.25em 0 0.5em;
18   color: #999;
19 }
20
21 .crumbs li a {
22   display: inline;
23   border: 0;
```

```
JS Tidy X
```

```
<ol>
  <li>Home</li>
  <li>Lovecraft</li>
  <li>Great Old Ones</li>
  <li>Cthulhu</li>
</ol>
```

It looks all fancy thanks to CSS!

You can nest unordered & ordered lists, as many levels deep as you'd like

```
HTML
1 <ol>
2   <li>Earth
3     <ol>
4       <li>Tarzan
5         <ol>
6           <li><i>Tarzan of the Apes</i></li>
7           <li><i>The Return of Tarzan</i></li>
8           <li><i>The Beasts of Tarzan</i></li>
9         </ol>
10      </li> <!-- end Tarzan -->
11      <li>Pellucidar</li>
12      <li>Caspak</li>
13    </ol>
14  </li> <!-- end Earth -->
15  <li>Other planets
16    <ol>
17      <li>Mars
18        <ol>
19          <li><i>A Princess of Mars</i></li>
20          <li><i>The Gods of Mars</i></li>
21          <li><i>The Warlord of Mars</i></li>
22        </ol>
23      </li> <!-- end Mars -->
24      <li>Venus</li>
25    </ol>
26  </li> <!-- end Other planets -->
27 </ol>
```

CSS

JS

1. Earth
  1. Tarzan
    1. *Tarzan of the Apes*
    2. *The Return of Tarzan*
    3. *The Beasts of Tarzan*
  2. Pellucidar
  3. Caspak
2. Other planets
  1. Mars
    1. *A Princess of Mars*
    2. *The Gods of Mars*
    3. *The Warlord of Mars*
  2. Venus

```
1 <ul>
2   <li>Great Old Ones
3     <ul>
4       <li>Cthugha</li>
5       <li>Cthulhu</li>
6       <li>Cyäegha</li>
7     </ul>
8 </li> <!-- end Great Old Ones -->
9 <li>Gods
10   <ul>
11     <li>Outer Gods
12       <ul>
13         <li>Azathoth</li>
14         <li>Nyarlathotep</li>
15         <li>Yog-Sothoth</li>
16       </ul>
17     </li> <!-- end Outer Gods -->
18     <li>Elder Gods
19       <ul>
20         <li>Bastet</li>
21         <li>Hypnos</li>
22         <li>Nodens</li>
23       </ul>
24     </li> <!-- end Elder Gods -->
25   </ul>
26 </li> <!-- end Gods -->
27 </ul>
```

- Great Old Ones
  - Cthugha
  - Cthulhu
  - Cyäegha
- Gods
  - Outer Gods
    - Azathoth
    - Nyarlathotep
    - Yog-Sothoth
  - Elder Gods
    - Bastet
    - Hypnos
    - Nodens

Combining `<u1>` & `<o1>` is a bit weird, but allowed

```
1 <ul>
2   <li>Earth
3     <ul>
4       <li>Tarzan
5         <ol>
6           <li><i>Tarzan of the Apes</i></li>
7           <li><i>The Return of Tarzan</i></li>
8           <li><i>The Beasts of Tarzan</i></li>
9         </ol>
10      </li> <!-- end Tarzan -->
11      <li>Pellucidar</li>
12      <li>Caspak</li>
13    </ul>
14  </li> <!-- end Earth -->
15  <li>Other planets
16    <ul>
17      <li>Mars
18        <ol>
19          <li><i>A Princess of Mars</i></li>
20          <li><i>The Gods of Mars</i></li>
21          <li><i>The Warlord of Mars</i></li>
22        </ol>
23      </li> <!-- end Mars -->
24      <li>Venus</li>
25    </ul>
26  </li> <!-- end Other planets -->
27 </ul>
```

- Earth
  - Tarzan
    1. *Tarzan of the Apes*
    2. *The Return of Tarzan*
    3. *The Beasts of Tarzan*
  - Pellucidar
  - Caspak
- Other planets
  - Mars
    1. *A Princess of Mars*
    2. *The Gods of Mars*
    3. *The Warlord of Mars*
  - Venus

The sub-list *must* nest inside the parent's `<li> ... </li>`

```
1 <div class="good">
2   <div></div>
3   <section>
4     <ol>
5       <li>Tarzan
6         <ol>
7           <li><i>Tarzan of the Apes</i></li>
8           <li><i>The Return of Tarzan</i></li>
9           <li><i>The Beasts of Tarzan</i></li>
10        </ol>
11      </li> <!-- end Tarzan -->
12      <li>Pellucidar</li>
13    </ol>
14  </section>
15 </div>
16 <div class="bad">
17   <div></div>
18   <section>
19     <ol>
20       <li>Tarzan</li>
21       <ol>
22         <li><i>Tarzan of the Apes</i></li>
23         <li><i>The Return of Tarzan</i></li>
24         <li><i>The Beasts of Tarzan</i></li>
25       </ol>
26       <li>Pellucidar</li>
27     </ol>
```

1. Tarzan
  1. *Tarzan of the Apes*
  2. *The Return of Tarzan*
  3. *The Beasts of Tarzan*
2. Pellucidar

1. Tarzan
  1. *Tarzan of the Apes*
  2. *The Return of Tarzan*
  3. *The Beasts of Tarzan*
2. Pellucidar

`<menu> ... </menu>`

Acts like `<ul>` in every way, except it is *semantically correct for building menus*

```
HTML
1 <h2><code>&lt;nav></code> &amp;
  <code>&lt;menu></code> without CSS</h2>
2
3 <nav>
4   <menu>
5     <li><a href="#">Life</a></li>
6     <li><a href="#">Writings</a></li>
7     <li><a href="#">Characters</a></li>
8     <li><a href="#">Influence</a></li>
9     <li><a href="#">Contact</a></li>
10  </menu>
11 </nav>
12
13 <h2><code>&lt;nav></code> &amp;
  <code>&lt;menu></code> with CSS</h2>
14
15 <nav class="styled">
16   <menu>
17     <li><a href="#">Life</a></li>
18     <li><a href="#">Writings</a></li>
19     <li><a href="#">Characters</a></li>
20     <li><a href="#">Influence</a></li>
CSS (SCSS)
JS
```

## <nav> & <menu> without CSS

- [Life](#)
- [Writings](#)
- [Characters](#)
- [Influence](#)
- [Contact](#)

## <nav> & <menu> with CSS

```
HTML
13 <h2><code>&lt;nav></code> &amp;
    <code>&lt;menu></code> with CSS</h2>
14
15 <nav class="styled">
16   <menu>

23 </nav>
```

```
CSS (SCSS)
1 nav.styled menu {
2   margin: 0;
3   padding: 0;
4   list-style: none;
5
6   li {
7     float: left;
8     display: block;
9     background: #4B4B4B;
```

```
JS
```

## <nav> & <menu> without CSS

- [Life](#)
- [Writings](#)
- [Characters](#)
- [Influence](#)
- [Contact](#)

## <nav> & <menu> with CSS

Originally, `<menu>` was supposed to include `<menuitem>` as children, & browsers were supposed to turn the following into a menu for users on a webpage:

```
<menu>  
  <menuitem>Tsathoggua</menuitem>  
  <menuitem>Cxaxukluth</menuitem>  
  <menuitem>Zstylzhemghi</menuitem>  
</menu>
```

This was never really supported, & `<menuitem>` is dead, as you can see in the compatibility chart

					ios		
<menu>	11	12	8	Y	Y	Y	Y

Note: the purpose of <menu> has changed. The old use with <menuitem> is not supported at all, but all browsers now support the new use with <li>, but compatibility charts have not been updated

```
<d1> ... </d1>
```

HTML 4: *Definition list*

HTML5: Renamed *Description List*

Lists terms & descriptions of those terms, like...

May have more than 1 `<dt>` and/or 1 `<dd>`

```
1 <dl>
2   <dt>H. P. Lovecraft</dt>
3     <dd>An American horror writer.</dd>
4     <dd>A psychedelic band from the 1960s.</dd>
5   <dt>Cthulhu</dt>
6   <dt>Yog-Sothoth</dt>
7     <dd>Malevolent creatures in the Cthulhu
8     Mythos</dd>
9 </dl>
```

H. P. Lovecraft

An American horror writer.

A psychedelic band from the 1960s.

Cthulhu

Yog-Sothoth

Malevolent creatures in the Cthulhu Mythos

## FORMATTING GUIDE

Don't do this — it makes your code harder to read

```
<dl>
  <dt>Cxaxukluth</dt><dd>Spawn of Azathoth;
  father of Hziulquoigmnzah & Ghisguth</dd>
  <dt>Hziulquoigmnzah</dt><dd>Son of
  Cxaxukluth; uncle of Tsathoggua</dd>
  <dt>Tsathoggua</dt><dd>Son of Ghisguth; aka
  the Sleeper of N'kai</dd>
</dl>
```

Just put `<dt>` & `<dd>` on separate lines

# FORMATTING GUIDE

```
<ul>
  <dl>
    <li><dt>Term</dt></li>
    <li><dd>Description</dd></li>
  </dl>
</ul>
```

No. Just no. 🤮

An unordered list inside `<dd>`? Maybe. But this? No.

# FORMATTING GUIDE

```
<p>  
  <ul>  
    ...  
  </ul>  
</p>
```

Never surround `<ul>`, `<ol>`, & `<dl>` with `<p>`

---

```
<ul>  
  ...  
</ul>
```

Links

<a>

<map> & <area>

<link>

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

## Password

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

## Host

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Top-Level Domain

```
http://foo:bar@www.example.com:80/calendar/index.php?month=10&week=3#thurs
```

## Second-Level Domain

```
http://foo:bar@www.example.com:80/calendar/index.php?month=10&week=3#thurs
```

## Third-Level Domain

This is commonly referred to as the *subdomain*. Technically each level of the domain name is a subdomain.

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Registered Domain Name

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Port

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Path

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Path Segment

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Path Segment

```
http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs
```

## Query

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

## Key-Value Pair

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

## Key

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

## Value

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

## Fragment Identifier

`http://foo:bar@www.websanity.com:80/calendar/index.php?month=10&week=3#thurs`

`<a> ... </a>`

*Anchor* that defines a hyperlink

`href` attribute (*hypertext reference*) is required

No `href`? No blue color, no underline... & no link!

```
1 <p>  
2   Don't blame me—I voted for <a href="http://cthulhu-  
   for-prez.com">Cthulhu</a>!  
3 </p>
```

Don't blame me—I voted for [Cthulhu!](http://cthulhu-for-prez.com)

`href` attribute must link to:

- » a URL; e.g., `https://cthulhu.com/hp1.html` or `/hp1.html`
- » a path; e.g., `hastur.html` or `dagon/` or `dagon/hastur.html` or `../dagon/hastur.html`
- » a query; e.g., `?monster=shoggoth`
- » a fragment identifier; e.g., `#cthulhu`
- » a combination of any of the above

2 places to link to with `<a>`

- » External: to another website, via *absolute URLs*\*
- » Internal: to other pages on your website, via *root-relative* or *document-relative* URLs

\* Yes, you can use absolute URLs to link to pages of the site you're already on, but you shouldn't

<https://cthulhu.com/hpl.html>

*Absolute* (complete) URL

Only way to create external links to other websites

You can use it for internal linking, but don't

`/hp1.html`

`/dagon/hastur.html`

*Root-relative URL*

Web server fills in scheme (`https://`) & domain  
(`foo.com`)

Always starts at root of website & continues from there

You're at `https://cthulhu.com/hp1.html`

You click on `<a href="/dagon/hastur.html">`

Your browser sees `/` at beginning & thinks, "This link points to another page at `https://cthulhu.com`"

The link is evaluated as `https://cthulhu.com/dagon/hastur.html`

You're at <https://granneman.com>

All of these links...

- » [/presentations/html-css-responsive-web-design/](https://granneman.com/presentations/html-css-responsive-web-design/)
- » [/writing/books/](https://granneman.com/writing/books/)
- » [/personal/bio/](https://granneman.com/personal/bio/)

...are evaluated as having <https://granneman.com> in front of them

## Why Flood Insurance in U.S. Is Broke and Broken

By MARY WILLIAMS WALSH  
12:51 PM ET

- A government-run program is virtually the only source of flood insurance for more than five million households.
- It keeps running out of money. Now, an unusual coalition of insurers, environmentalists and fiscal conservatives is calling for major changes.

Or a list of files (this should be *very* rare!)

 PRO TIP

When you request a URL that points to a directory instead of an actual webpage, the web server will (usually) serve a *default* (AKA *main* or *index*) page

Apache	IIS	Nginx
<code>index.html</code>	<code>default.htm</code>	<code>index.html</code>
<code>index.php</code>	<code>default.asp</code>	<code>index.htm</code>
<code>index.htm</code>	<code>default.aspx</code>	<code>index.php</code>
<code>index.shtml</code>	<code>index.htm</code>	
	<code>index.html</code>	
	<code>iisstart.htm</code>	

Typical default pages — but you can enter any you want

💡 PRO TIP

💡 PRO TIP

To understand *document-relative URLs*, you need to understand the basics of how *paths* work

Computer paths specify where a file or folder is located

⊞: C:\Users\scott\Pictures\yog-sothoth.jpg

🍏: /Users/scott/Pictures/yog-sothoth.jpg

## SIDE NOTE

None of these will ever work on the public Web, so *never* use them as the value of `href`:

- » `C:\Users\HPL\Documents\cthulhu.html`
- » `\Documents\cthulhu.html`
- » `\cthulhu.html`
- » `file:///anything`

Web servers use a specified folder as the *root folder* of a website

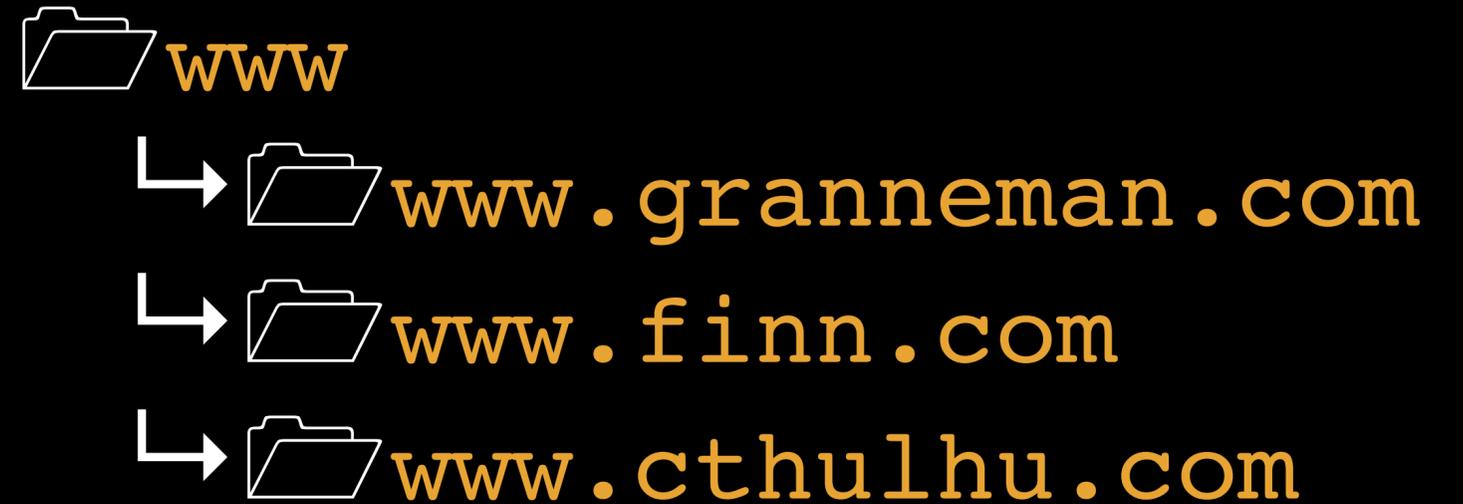

Everything in the root folder *is* the website

On \*nix, website root folders go inside `/var/www`

All the files & assets for my website go inside `www.granneman.com`

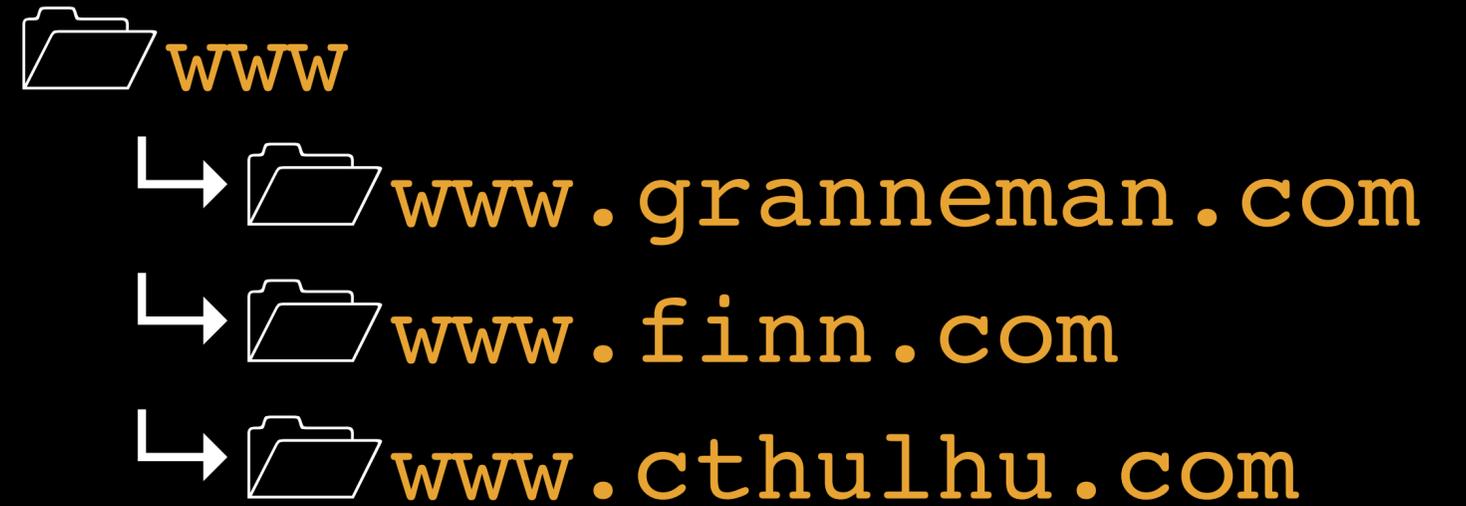

All the files & assets for Finn's website go inside `www.finn.com`

And so on

When the web server is serving files from `www.cthulhu.com`, it acts as though `www.cthulhu.com` is the only folder on the server

Every internal link is based on the fact that everything exists *solely inside* `www.cthulhu.com`

Start with standard folders  
& a default page

The 4 folders & the file are  
all *siblings*, in the same  
folder

The 4 folders & the file are  
also *children* of the  
`www.granneman.com` folder

Add a `privacy.html` page

`index.html` & `privacy.html`  
are now siblings

`index.html` needs to link to  
`privacy.html`

Since they're in the same  
folder, linking is easy:

```
<a href="privacy.html">
```

This is true for sibling files  
in any folder

Add another folder with files  
in it: `web-dev/browsers`

`index.html` needs to link to  
its other 3 sibling webpages

```
<a href="chrome.html">  
<a href="firefox.html">  
<a href="safari.html">
```

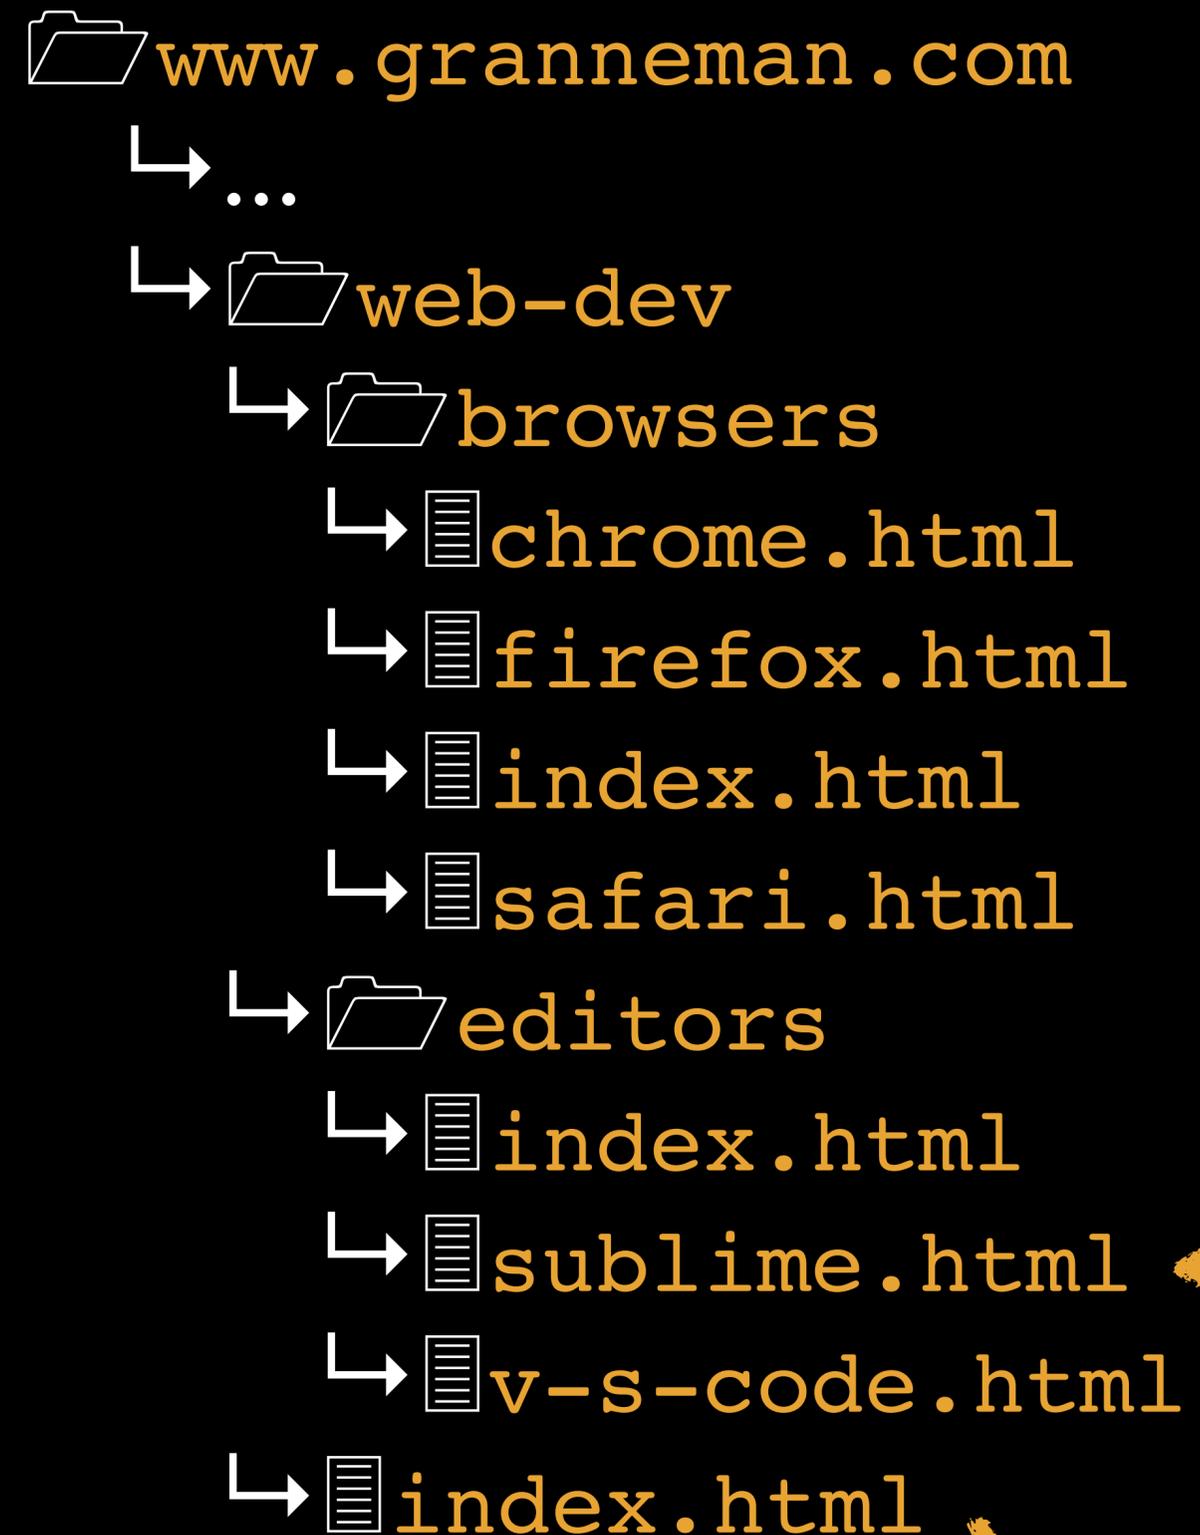

Add more files & folders

Create a link on `web-dev/index.html` pointing to `sublime.html`:

```
<a href="editors/  
sublime.html">
```

`web-dev/index.html` is a sibling of `editors`, so go into it & find `sublime.html`

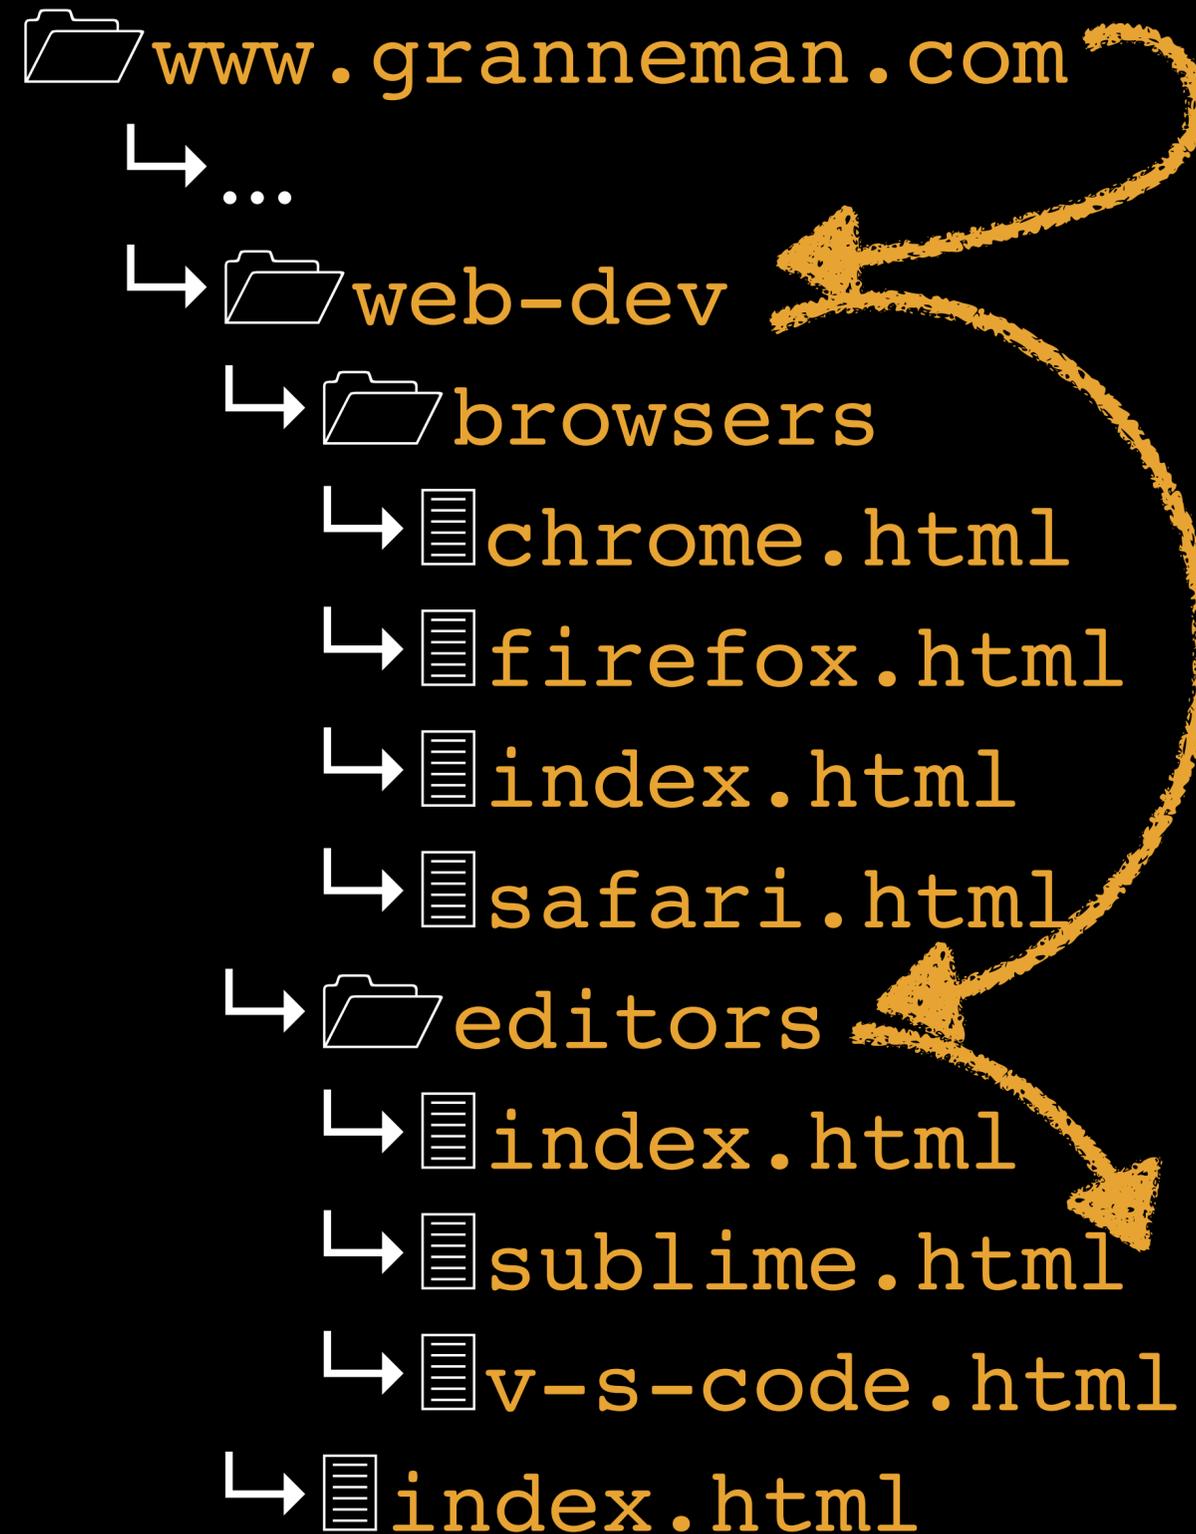

## 💡 PRO TIP

Remember root-relative URLs that start with `/`?

You could do that here too:

```
<a href="/web-dev/editors/sublime.html">
```

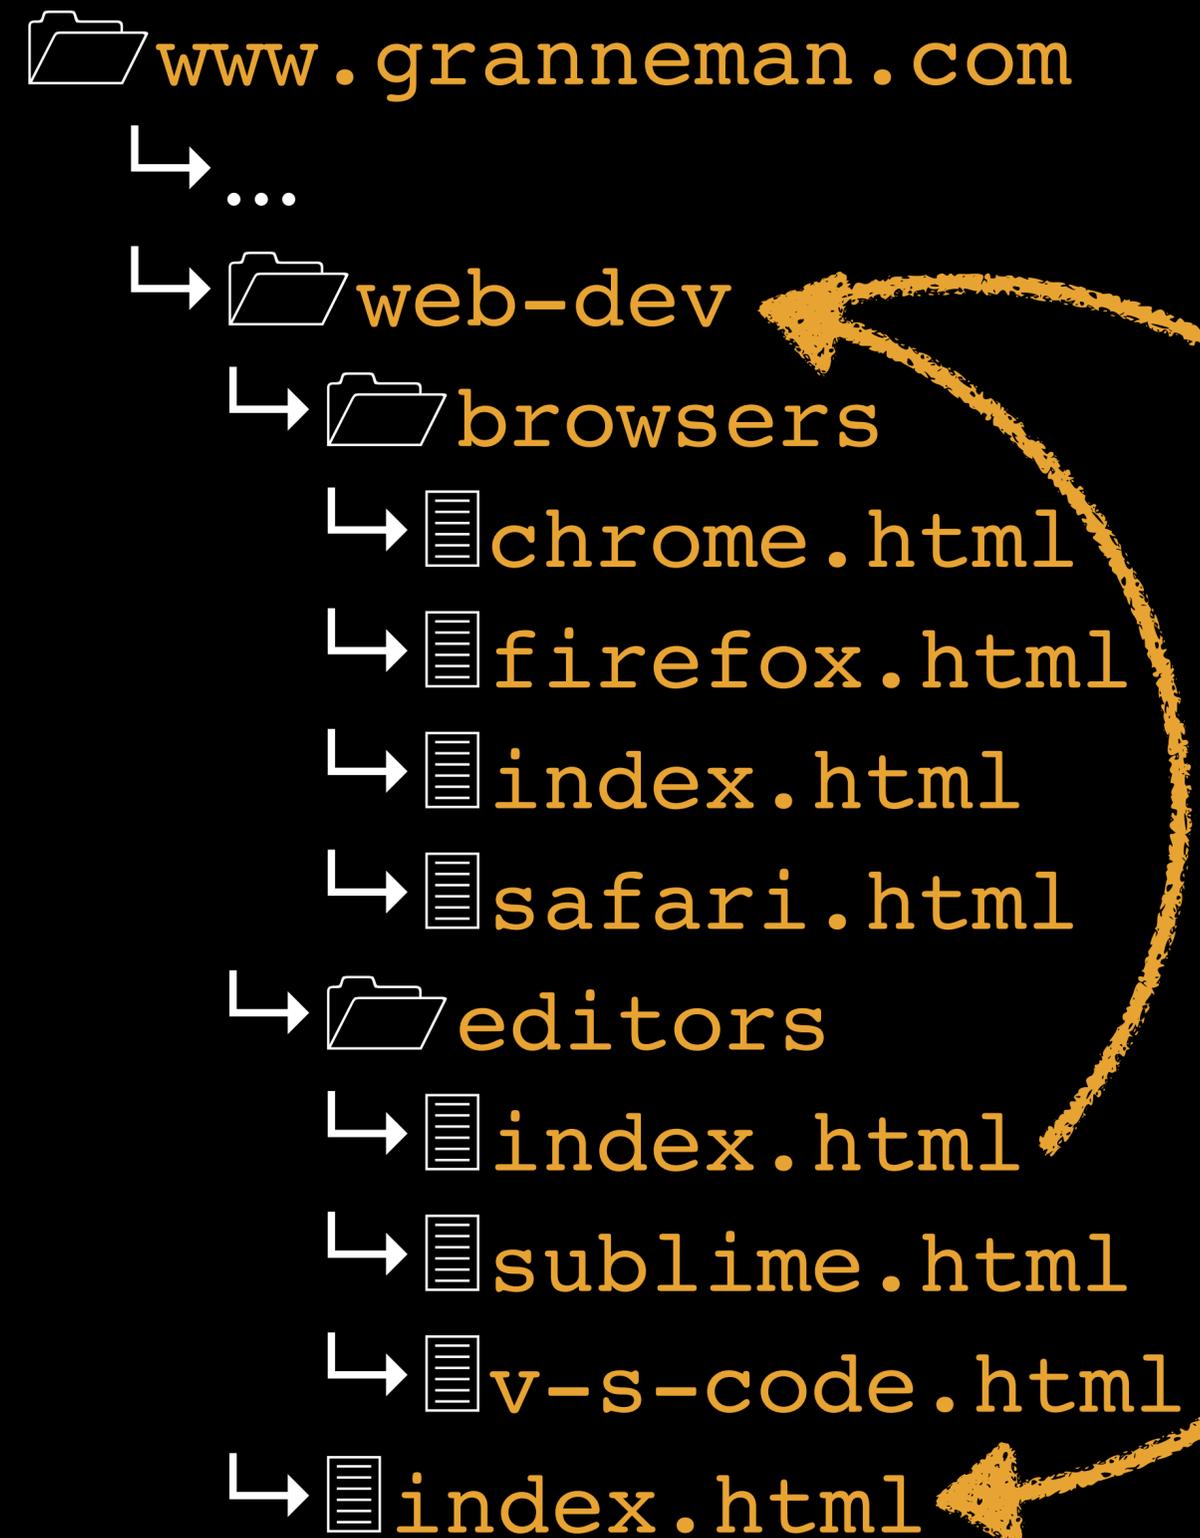

Start at `/`, go down into `web-dev`, then into `editors`, & then find `sublime.html`

What if I want to link from  
`editors/index.html` to  
`web-dev/index.html`?

```
<a href=" ../index.html">
```

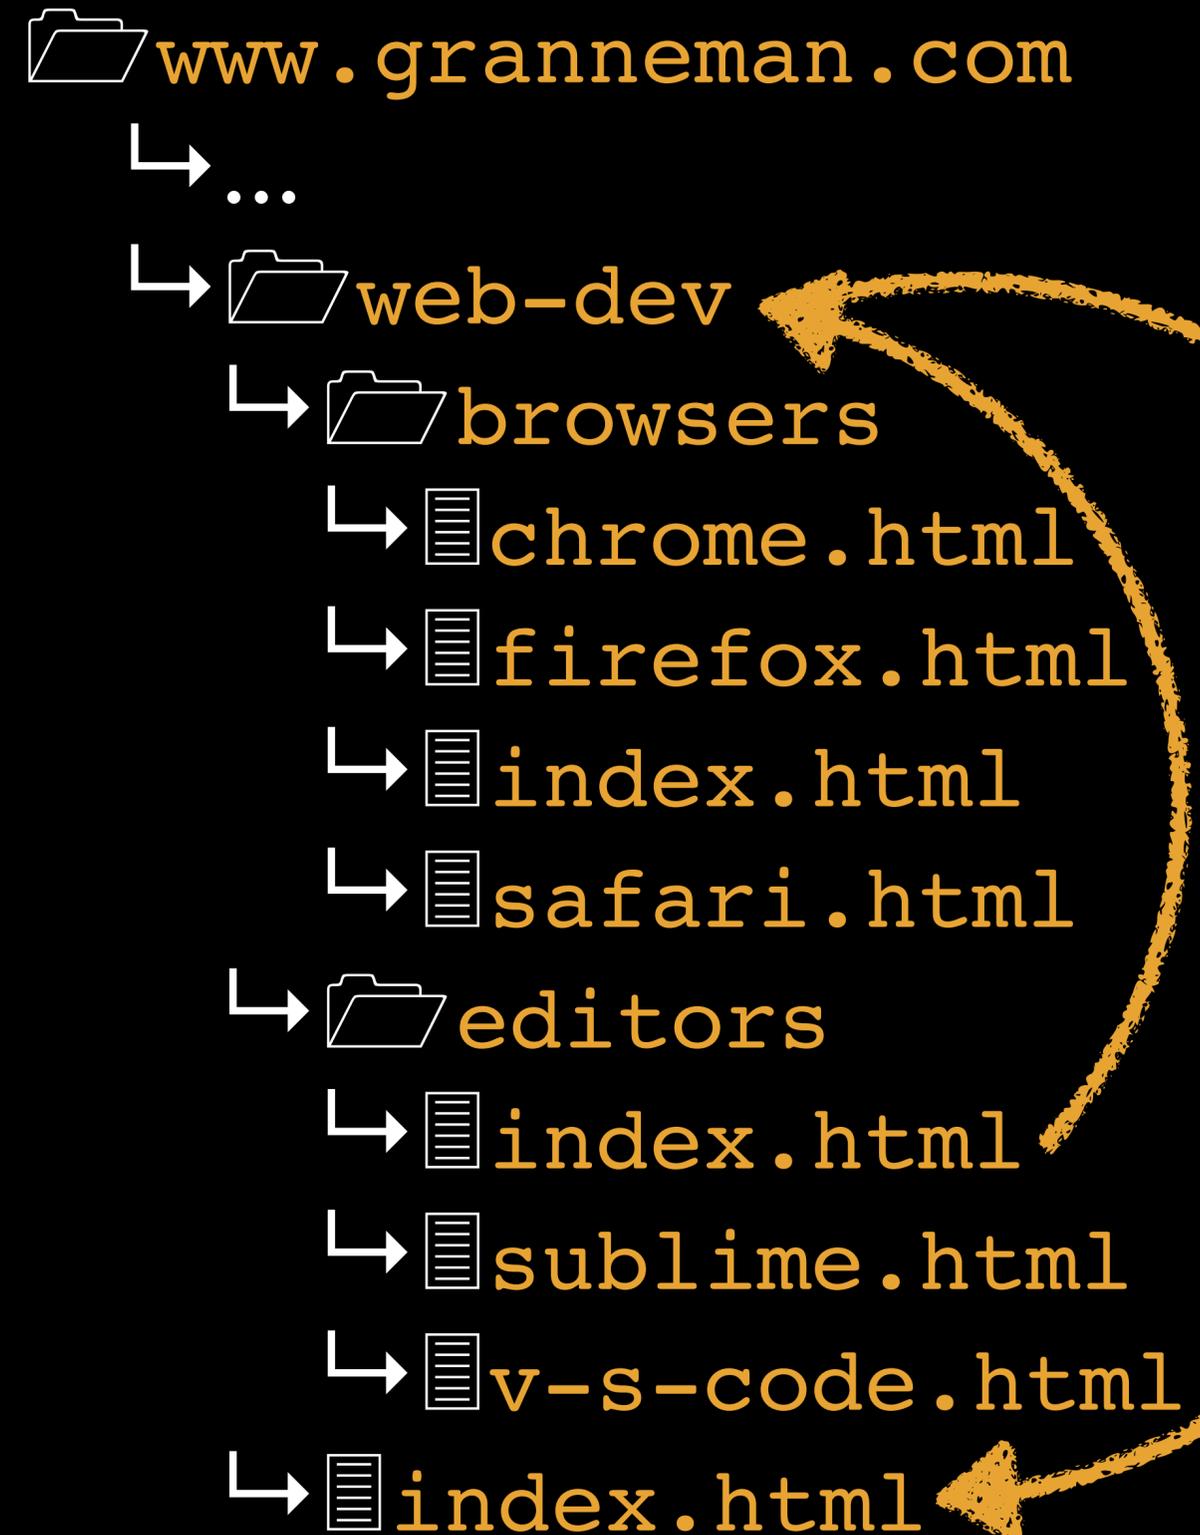

`..` means go *up* one  
directory, so go up from  
`editors` into `web-dev` &  
find `index.html`

`index.html` is a default page, however, so actually we could do this:

```
<a href=".." />
```

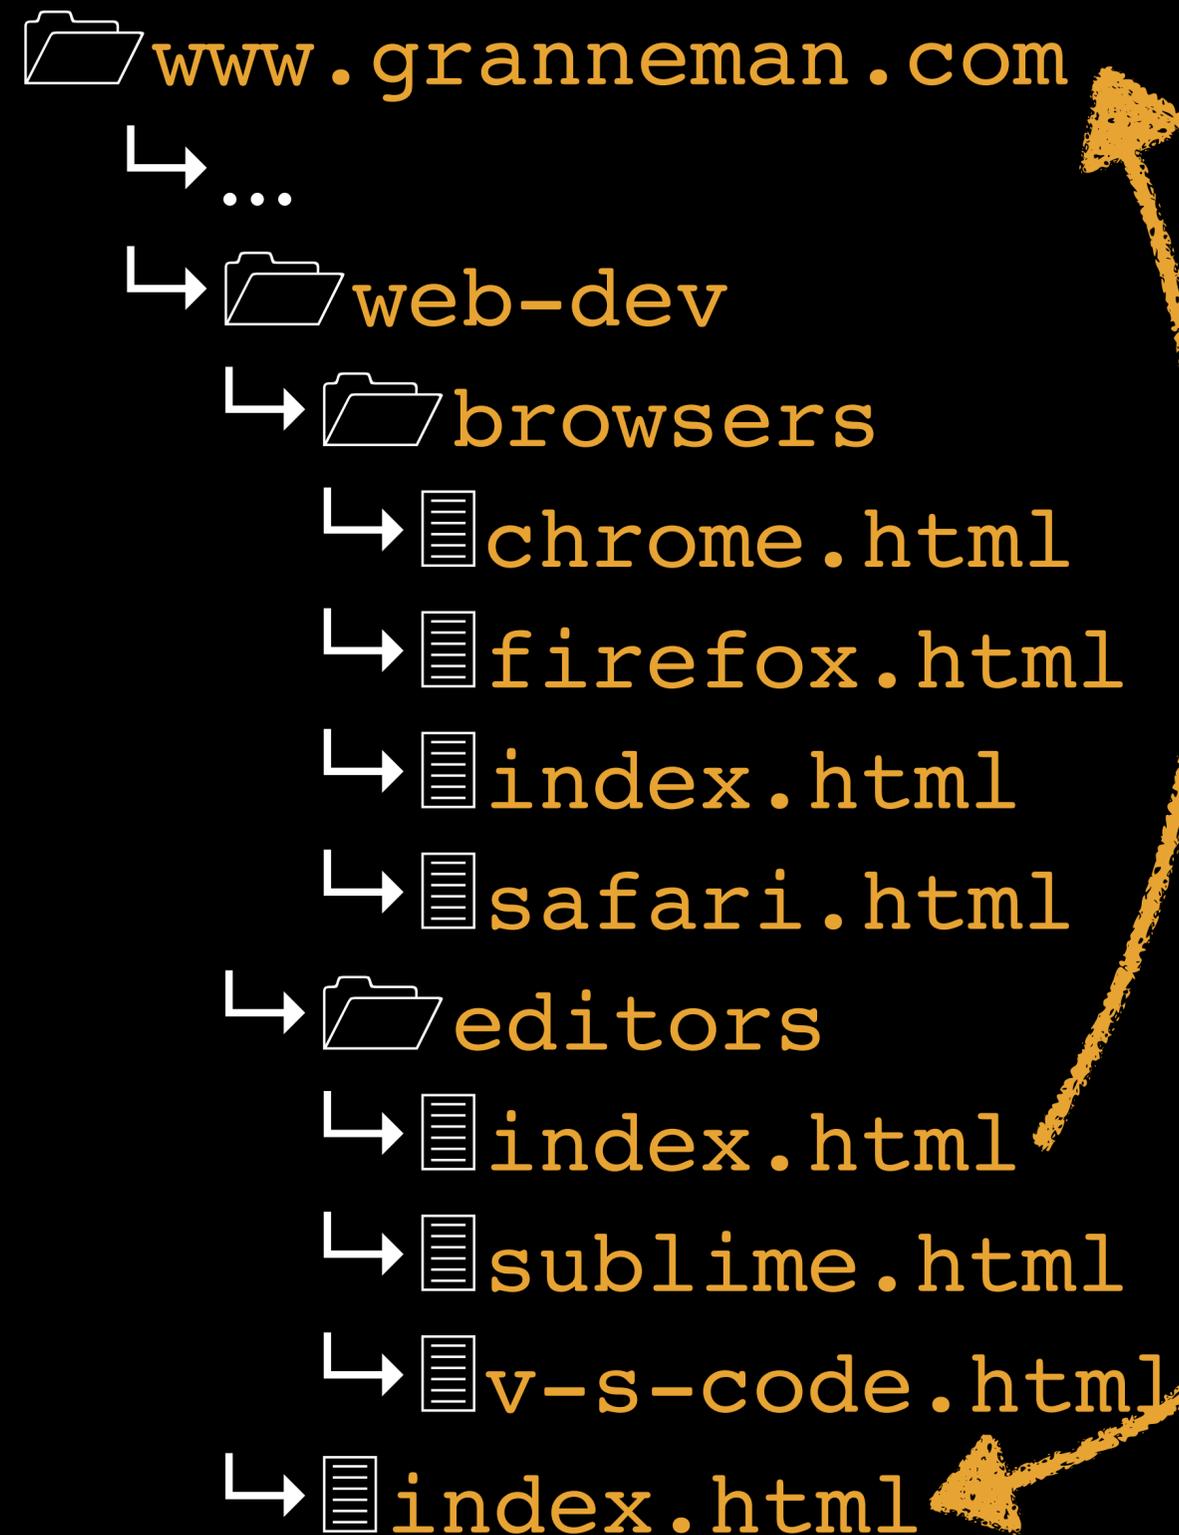

`..` means go up from `editors` into `web-dev` & find the default page, which is `index.html`

Or we could use a root-relative URL along with the default page!

```
<a href="/web-dev/">
```

Start at `/`, go down into `web-dev`, & then find the default page, which is `index.html`

Add some sections that'll  
be on my website

```
www.granneman.com
├── css
├── fonts
├── images
├── index.html
├── js
├── presentations
├── teaching
├── web-dev
└── writing
```

I need to link `index.html` to `main.css`

`index.html` & the `css` folder are siblings

`main.css` is the child of `css`

```
<link ... href="css/  
main.css">
```

To link to `main.css`, `index.html` has go into `css`, & then select `main.css`

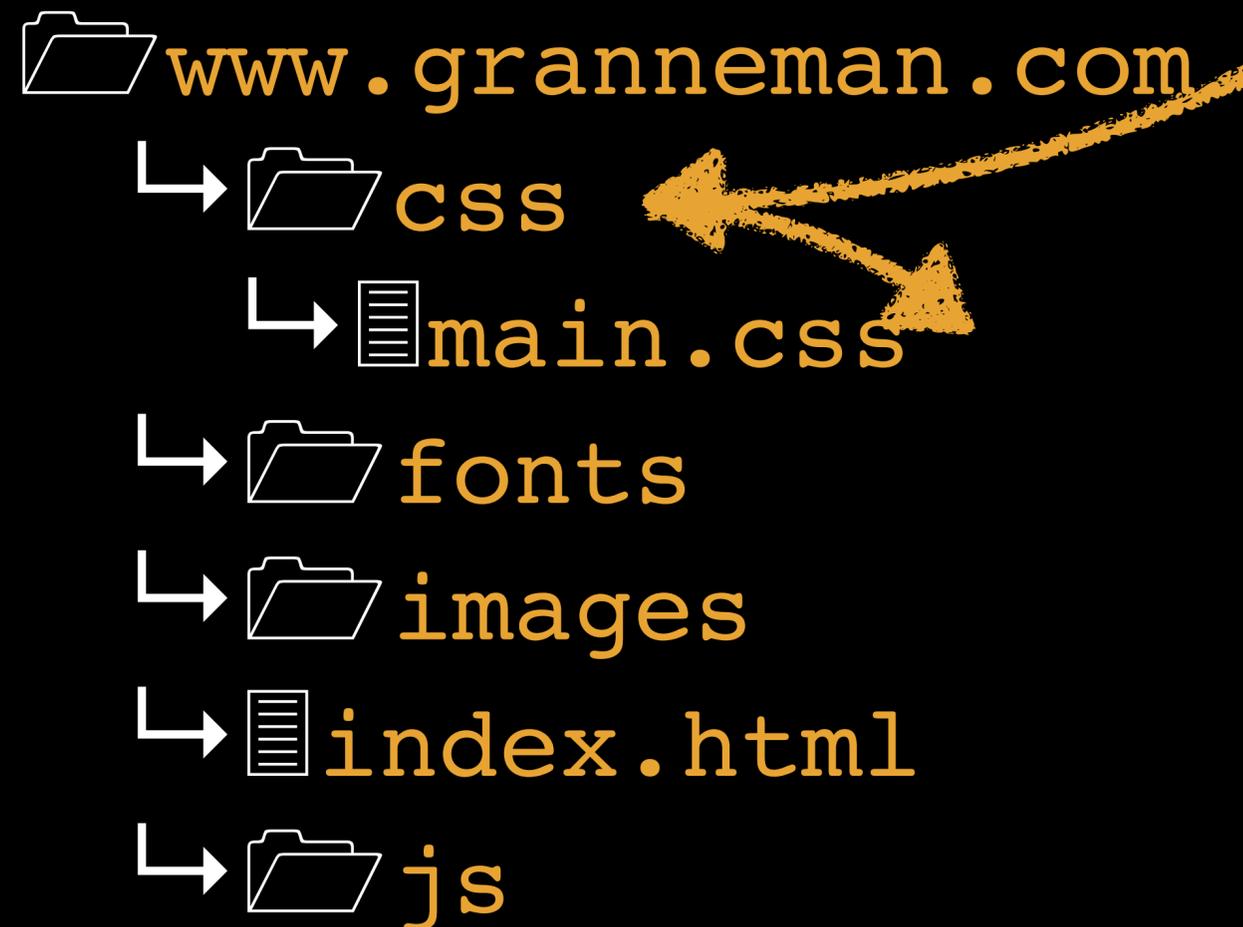

💡 PRO TIP

Remember root-relative URLs that start with `/`?

You could do that here too:

```
<link ... href="/css/main.css">
```

Start at `/`, go down into `css`, & then find `main.css`

(Actually, this is what I always do when linking to CSS)

Absolute	<code>https://cthulhu.com/hpl.html</code>	Complete URL
Root-relative	<code>/hpl.html</code> <code>/dagon/hastur.html</code>	Web server fills in scheme & domain
Document-relative	<code>hpl.html</code>	Same directory
	<code>dagon/hastur.html</code>	Down into sub-directory
	<code>../dagon/hastur.html</code>	Up into parent directory

## Page fragments & fragment identifiers

Name preceded by #, specifying an internal location in a webpage that is targeted using the `id` attribute

Can be pointed to on the same page, from other pages on the same site, or from other sites

```
1 <h3 id="toc">Table of Contents</h3>
2 <ul>
3   <li><a href="#the-tomb">The Tomb</a></li>
4   <li><a href="#dagon">Dagon</a></li>
5   <li><a href="#beyond-the-walls">Beyond the Walls
6     of Sleep</a></li>
7 </ul>
8 <hr>
9
10 <h3 id="the-tomb">The Tomb <a href="#toc">[TOC]</a>
11 </h3>
12 <p>In relating the circumstances which have led to
13 my confinement...</p>
14
15 <h3 id="dagon">Dagon <a href="#toc">[TOC]</a></h3>
16 <p>I am writing this under an appreciable mental
17 strain...</p>
18
19 <h3 id="beyond-the-walls">Beyond the Walls of Sleep
20 <a href="#toc">[TOC]</a></h3>
21 <p>I have frequently wondered if the majority of
22 mankind...</p>
```

## Table of Contents

- [The Tomb](#)
- [Dagon](#)
- [Beyond the Walls of Sleep](#)

---

### The Tomb [\[TOC\]](#)

In relating the circumstances which have led to my confinement...

### Dagon [\[TOC\]](#)

I am writing this under an appreciable mental strain...

### Beyond the Walls of Sleep [\[TOC\]](#)

I have frequently wondered if the majority of mankind...

Hey, old-timers! 🧓 🧔

Do not make a “named anchor” or a “bookmark” like this:

```
<h2><a name="hp1"></a>H.P. Lovecraft</h2>
```

Obsolete! Use this instead:

```
<h2 id="hp1">H.P. Lovecraft</h2>
```

Use `target="_blank"` to open the URL in a new browser tab

```
<a href="cthulhu.html" target="_blank">
```

However, this is often very confusing &/or annoying to users — & it breaks the back button!

Do *not* do this unless you have a very good reason!

Bad reasons for `target="_blank"`

- » You like it
- » You want to keep users on your webpage
- » You're linking to a PDF

OK reasons for `target="_blank"`

- » User-initiated media is playing
- » You need to link to info a user needs while filling out a form

## 💡 PRO TIP

For security reasons, you must also use

`rel="noopener"`:

```
<a href="cthulhu.html" target="_blank"  
rel="noopener">
```

For more info, see [mathiasbynens.github.io/rel-noopener/](https://mathiasbynens.github.io/rel-noopener/)

Want to create a fake link that looks like a hyperlink but doesn't go anywhere?

Do not use `<a href="#">Oops</a>`, as that will jump to the top of the page when clicked

Use one of these:

- » `<a href="#">Fake!</a>` ★
- » `<a href="#id-that-does-not-exist">Fake!</a>` ★
- » `<a href="javascript:void(0)">Fake!</a>`
- » `<a href="#" onClick="return false;">Fake!</a>`

For email links, use

```
href="mailto:name@example.com"
```

You can also include a subject & CC addresses, but those are not as widely supported

```
1 <h3>Email address</h3>
2 <p>
3   <a
4     href="mailto:cthulhu@rlyeh.com">Email
5     Cthulhu</a>
6 </p>
7 <h3>Email address with Subject</h3>
8 <p>
9   <a href="mailto:cthulhu@rlyeh.com
10    ?subject=Stay%20sleeping">Email
11    Cthulhu</a>
12 </p>
13 <h3>Email address with Subject & CC</h3>
14 <p>
15   <a href="mailto:cthulhu@rlyeh.com
16    ?subject=Stay%20sleeping
17    &Cc=herbert.west@miskatonic.edu">Email
18    Cthulhu</a>
19 </p>
```

## Email address

[Email Cthulhu](mailto:cthulhu@rlyeh.com)

## Email address with Subject

[Email Cthulhu](mailto:cthulhu@rlyeh.com?subject=Stay%20sleeping)

## Email address with Subject & CC

[Email Cthulhu](mailto:cthulhu@rlyeh.com?subject=Stay%20sleeping&Cc=herbert.west@miskatonic.edu)

If your link is simply `<a href="mailto:">`, a new email window will open in the user's mail client with no destination address at all

The user can then set the TO & the SUBJECT for herself

If you use webmail (e.g., Gmail, Yahoo, Outlook.com), clicking on a `mailto` link probably will not open a new email

You'll need to follow the instructions at “A guide to getting webmail services to work with `mailto` links” ([chnsa.ws/yc](http://chnsa.ws/yc)) ... & even then, they might not work

For phone numbers, use `href="tel:+18005551212"`

On mobile devices, clicking opens your phone app

On desktops, it depends on your OS & software

- » On my Mac, it opens FaceTime
- » On Jans' Mac, he is prompted to use FaceTime or Skype
- » On Windows, you're asked to pick an app

# What about extensions?

, adds a *pause*

; adds a *wait* (a long pause)

```
<a href="tel:+18005551212;123">Call us!</a>
```

For addresses, use:

```
<a href="http://maps.apple.com/?q=454+Angell+St+Providence+RI+02906">address</a>
```

```
<a href="http://maps.apple.com/?q=02906">address</a>
```

```
<a href="http://maps.apple.com/?q=Providence+RI">address</a>
```

Use `maps.apple.com` — it works on every browser & on every OS!

[▼ Table of Contents](#)[Introduction](#)[Mail Links](#)[Phone Links](#)[FaceTime Links](#)[SMS Links](#)[Map Links](#)[iTunes Links](#)[YouTube Links](#)[Revision History](#)[Previous](#) [Next](#)

# Map Links

The maps URL scheme is used to show geographical locations and to generate driving directions between two points. If your app includes address or location information, you can use map links to open that information in the Maps app in iOS or macOS.

Unlike some schemes, map URLs do not start with a “maps” scheme identifier. Instead, map links are specified as regular `http` links and are opened either in Safari or the Maps app on the target platform.

Table 5–1 lists the supported parameters along with a brief description of each.

**Table 5–1** Supported Apple Maps parameters

Parameter	Meaning	Values
<code>t</code>	The map type. If you don't specify one of the documented values, the current map type is used.	<ul style="list-style-type: none"> <li>▪ <code>m</code> (standard view)</li> <li>▪ <code>k</code> (satellite view)</li> <li>▪ <code>h</code> (hybrid view)</li> <li>▪ <code>r</code> (transit view)</li> </ul>
<code>q</code>	The query. This parameter is treated as if its value had been typed into the Maps search field by the user. Note that <code>q=*</code> is not supported The <code>q</code> parameter can also be used as a label if the location is explicitly defined in the <code>ll</code> or <code>address</code> parameters.	A URL-encoded string that describes the search object, such as “pizza,” or an address to be geocoded
<code>address</code>	The address. Using the address parameter simply displays the specified location, it does not perform a search for the location.	An address string that geolocation can understand.
<code>near</code>	A hint used during search. If the <code>sll</code> parameter is missing or its value is incomplete, the value of <code>near</code> is used instead.	A comma-separated pair of floating point values that represent latitude and longitude (in that order)

A Uniform Resource Identifier for Geographic Locations ('geo' URI)

Abstract

This document specifies a Uniform Resource Identifier (URI) for geographic locations using the 'geo' scheme name. A 'geo' URI

There is a **geo:** URI scheme

Only Android supports it, but its implementation doesn't adhere to the actual standard 🤪

`bingmaps:`, `ms-drive-to:`, & `ms-walk-to:` work on  
Windows

`maps:` works on Android & Windows

*Scheme (protocol)-relative URLs* leave out `http(s):`

`//www.miskatonic-expedition.com/elder-ones.htm`

If the page is served via http, the browser uses http

If the page is served via https, the browser uses https

Actually, do NOT use protocol-relative URLs, as it's insecure (why encourage links that use HTTP?)

Just use HTTPS wherever you can

If your site is on HTTP, it's perfectly safe to request HTTPS assets (if your site is on HTTPS, you cannot request HTTP assets)

Before HTML5 👎  
Not DRY

HTML5 👍  
DRY

`<map> ... </map>`

Defines an *image map*, a list of coordinates that define hyperlinked areas on an image

`shape` attribute's value can be `rect`, `poly`, or `circle`

`<area> ... </area>`

Defines a *linked section* in an image map

Must be inside `<map>`

```

3 <figure>
4 
5 <map name="miskatonic-map"
  id="miskatonic-map">
6 <area id="carter-hall" alt="Carter
  Hall" title="Carter Hall"
  href="http://www.miskatonic-
  expedition/carter-hall/" shape="rect"
  coords="56,154,202,301"></area>
7 <area id="locksley-hall"
  alt="Locksley Hall" title="Locksley
  Hall" href="http://www.miskatonic-
  expedition/locksley-hall/"

Big problem with image maps is they're not responsive

The images can be resized, but the coordinates cannot  
(without a lot of extra work & JavaScript)!

A better way to create a modern image map is with *SVG*

```
1 <svg xmlns="http://www.w3.org/2000/svg" viewBox="0 0 1600 912">
2   <defs>
3     <style>
4       a > * { opacity: 0; }
5     </style>
6   </defs>
7   <image width="1600" height="912" href="https://i.redd.it/lqay9nmlb4q21.jpg"/>
8   <a href="https://miskatonic.edu/athletic-fields/" title="Athletic Fields">
9     <polygon points="378.961 624.355 458.775 575.239 682.03 713.657 584.914 781.192 406.868 668.448
10    406.868 643.89 378.961 624.355"/>
11  </a>
</svg>
```

`<link>`

Indicates a *relationship* with another linked document

Must go in `<head>` & may have multiple `<link>` elements in `<head>`

No `</link>`!

`rel` attribute (`<link rel="[value]">`) defines the relationship

```
<head>  
  <link rel="stylesheet" href="main.css">  
  <link rel="prev" href="chapter-1.htm">  
  <link rel="next" href="chapter-3.htm">  
</head>
```

Google Webmasters   
@googlewmc

Follow

Spring cleaning!

As we evaluated our indexing signals, we decided to retire rel=prev/next.

Studies show that users love single-page content, aim for that when possible, but multi-part is also fine for Google Search. Know and do what's best for *\*your\** users!

[#springiscoming](#)

6:45 AM - 21 Mar 2019

Googlebot no longer looks at either `rel="prev"` or `rel="next"`

Why? A Google engineer explained that “Googlebot is smart enough to find your next page by looking at the links on the page, we don’t need an explicit ‘`prev, next`’ signal.”

alternate

noreferrer

opener

pingback

preconnect

prefetch

preload

prerender

prev

search

stylesheet

tag

WHATWG's predefined values for `rel` attribute

`rel="alternate"`

Either an alternate style sheet or an RSS or ATOM feed

`rel="icon"`

Browser *favicon* or icons used by other devices

`rel="nofollow"`

Current webpage doesn't endorse the linked-to webpage

`rel="shortlink"`

Specifies a short link to use for the webpage

## 💡 PRO TIP

Several `rel` values focus on fine tuning resource loading by telling the browser to do something in advance

- » `preconnect`: open connection to linked website without downloading anything
- » `prefetch`: fetch linked resource because it's likely to be requested by user
- » `preload`: download something (CSS, JS, `<img>`) because it will be needed later on the current webpage
- » `prerender`: fetch linked webpage & render content offscreen
- » `dns-prefetch`: look up DNS before a user clicks a link

## 💡 PRO TIP

as

`<link>` attribute only used when `rel="preload"` or `rel="prefetch"` has been set & *specifies the type of content* being loaded

```
<link rel="prefetch" as="video" href="trailer.m4v">
```

## Some values for `as`

- » `audio: <audio>`
- » `document: <iframe> & <frame>`
- » `embed: <embed>`
- » `font: CSS @font-face`
- » `image: <img> & <picture>` with `srcset` or `imageset` attributes, SVG `<image>`, & CSS `*-image` rules

## Some values for `as`

- » `object: <object>`
- » `script: <script>`
- » `style: <link rel="stylesheet"> & CSS @import`
- » `track: <track>`
- » `video: <video>`

## SIDE NOTE

The list of **rel** values at WHATWG is not the entire list

Organizations can register extensions to the predefined list

You can see the list of 98\* “HTML5 link type extensions” at the Microformats Wiki (link in Notes)

\* As of June 2020

## SIDE NOTE

Examples include:

amphtml • apple-touch-icon • archived • canonical •  
category • code-license • chrome-webstore-item •  
content-license • discussion • dns-prefetch •  
import • root • lightbox • manifest • pgpkey •  
pingback • preconnect • prerender • shortlink •  
sitemap • syndication • widget

`integrity`

Value is a base64-encoded cryptographic hash (SHA-256, SHA-384, or SHA-512) of requested file so browser can verify the file hasn't been tampered with

```
integrity="sha384-GJzZqFGwb1QTTN6wy59ffF1BuGJp  
LSa9DkKMP0DgiMDm4iYMj70gZWKYbI706tWS"
```

16

To generate the hash yourself:

```
$ openssl dgst -sha384 -binary cthulhu.css | openssl  
base64 -A
```

```
u5RnNZ22Sd1Zwh+VBKJdG2PI0uX5C+26wTRc/F0GfSGHxLyYwXvby4  
ZonSsizaB3
```

Then do this:

```
<link rel="stylesheet" href="https://miskatonic-  
expedition.com/css/cthulhu.css" integrity="sha384-  
u5RnNZ22Sd1Zwh+VBKJdG2PI0uX5C+26wTRc/F0GfSGHxLyYwXvby  
4ZonSsizaB3" crossorigin="anonymous"></script>
```

# SRI Hash Generator

Enter the URL of the resource you wish to use:

Hash!

```
<script src="https://raw.githubusercontent.com/rsgranne/Brackets-HTML-Templates-Updated/master/main.js" integrity="sha384-uRb8FnWmFz/zoPMZQzAjMqSti0Mtn3be2aJTMU7vWlfTugXRUp5nVJAJM5a5Ess" crossorigin="anonymous"></script>
```

What is Subresource Integrity?

*Cross-Origin Resource Sharing (CORS)* uses HTTP headers to give the webpage access in a secure way to a resource from a different *origin* (domain, protocol, or port)

Why? Mitigate the risks of cross-origin HTTP requests

CORS comes into play when making cross-site requests for:

- » Invocations of the `XMLHttpRequest` (AJAX) or Fetch APIs, as discussed above
- » Web Fonts using `@font-face`
- » WebGL textures
- » Images or video frames drawn to `<canvas>` using `drawImage()`
- » CSS Shapes from images

Web server's HTTP header `Access-Control-Allow-Origin` controls CORS access

`Access-Control-Allow-Origin: *` means that any domain can access the resource

`Access-Control-Allow-Origin: https://cthulhu.com` means that only `cthulhu.com` can access the resource

# Scott Granneman

Home

Home

**Scott Granneman** is an [author](#), [educator](#), & partner in a Web development company in St. Louis, Missouri. Scott has written six books, contributed to two, and penned monthly columns for SecurityFocus and *Linux Magazine*. He is an Adjunct Professor at Washington University in St. Louis & Webster University, [teaching courses](#) on technology, security, web development, & the Internet. As a Principal of [WebSanity](#), he plans, develops, and hosts websites for clients in 12 states using an open source, UNIX-based [content management system](#). He has given [presentations](#) all over the United States, and loves speaking to people.

## Key Site Links

CORS failures result in errors, but for security reasons, specifics are not available to JavaScript

The *only* way to determine what went wrong is to look at the browser's console in Developer Tools

				ios		
Access-Control-Allow-Origin	9	3.5	3.1	3.1	3	2.3
CORS	10*	3.5	4†	3.2†	4*	4.4

\* Doesn't support `<img>` in `<canvas>` † Doesn't support `<video>` in `<canvas>`

## crossorigin

Provides support for CORS by defining how `<link>` handles giving the webpage access to a resource from a different origin

Also valid on `<audio>`, `<img>`, `<script>`, & `<video>`

## `crossorigin` values

- » `anonymous`: credentials flag set to `same-origin`, so resource will be fetched without any exchange of user credentials via cookies, client-side SSL certificates, or HTTP authentication
- » `use-credentials`: credentials flag set to `include`, so resource to be fetched requires exchange of user credentials

If the attribute isn't used, CORS isn't used

<code>&lt;link&gt;</code>					ios		
<code>rel</code>	Y	12	2	Y	Y	4	Y
<code>rel.dns-prefetch</code>	10	12	3.5‡	5	?	4	Y

<code>rel.preload</code>	?	17	57*	11.1	11.3	50	50
<code>rel.prerender</code>	11	79	—	—	—	13	18

\* Can be enabled with `network.preload` flag

† Enable `LinkPrefetch` in the Develop menu

‡ HTTPS is unsupported

<link>					iOS		
integrity	-	79	?	-	-	45	Y
crossorigin	-	79	18	?	?	25	Y

# Embedded Multimedia

<img>

<picture>

<video>, <audio>, <source>, <track>

<iframe>

<object> & <param>

<embed>

## Replaced elements

Reference to external or generated content in the code

Cannot control all aspects with CSS

Usually no closing tag

`<img>`, `<input>`, `<object>`,  
`<textarea>`, `<video>`

## Non-replaced elements

Content contained in the code

Can control all aspects with CSS

Usually a closing tag

`<div>`, `<p>`, `<a>`, `<b>`, `<em>`,  
`<span>`

`<img>`

Embedded *image*

`src` attribute is required (just like `href` for `<a>`)

## `width`

- » Width of image in pixels
- » Unimportant with responsive web design\*

## `height`

- » Height of image in pixels
- » Unimportant with responsive web design\*

\* In which case the `width` & `height` are defined in CSS

## alt

*Alternate* text information describing image for those with visual disabilities or images turned off

Was required by HTML 4, but HTML5 changes this

- » Omitting `alt` tells rendering engine that the image is *vital, but no textual equivalent* is available
- » Using `alt=""` tells rendering engine that the image is *not vital*, so non-visual browsers may omit it

# FORMATTING GUIDE

Be careful using quotation marks in values

This will cause problems:

```
<img alt="Cthulhu says "This is tasty!" "> 
```

`alt` text,  
to browser

Ignored  
by browser

# FORMATTING GUIDE

Get rid of the quotation marks that do not explicitly begin & end the value:

```
<img alt="Cthulhu says This is tasty!">
```

Or use single quotes:

```
<img alt="Cthulhu says 'This is tasty!'">
```

# FORMATTING GUIDE

Or use typographer's ("curly") quotes:

```
<img alt="Cthulhu says "This is tasty!" ">
```

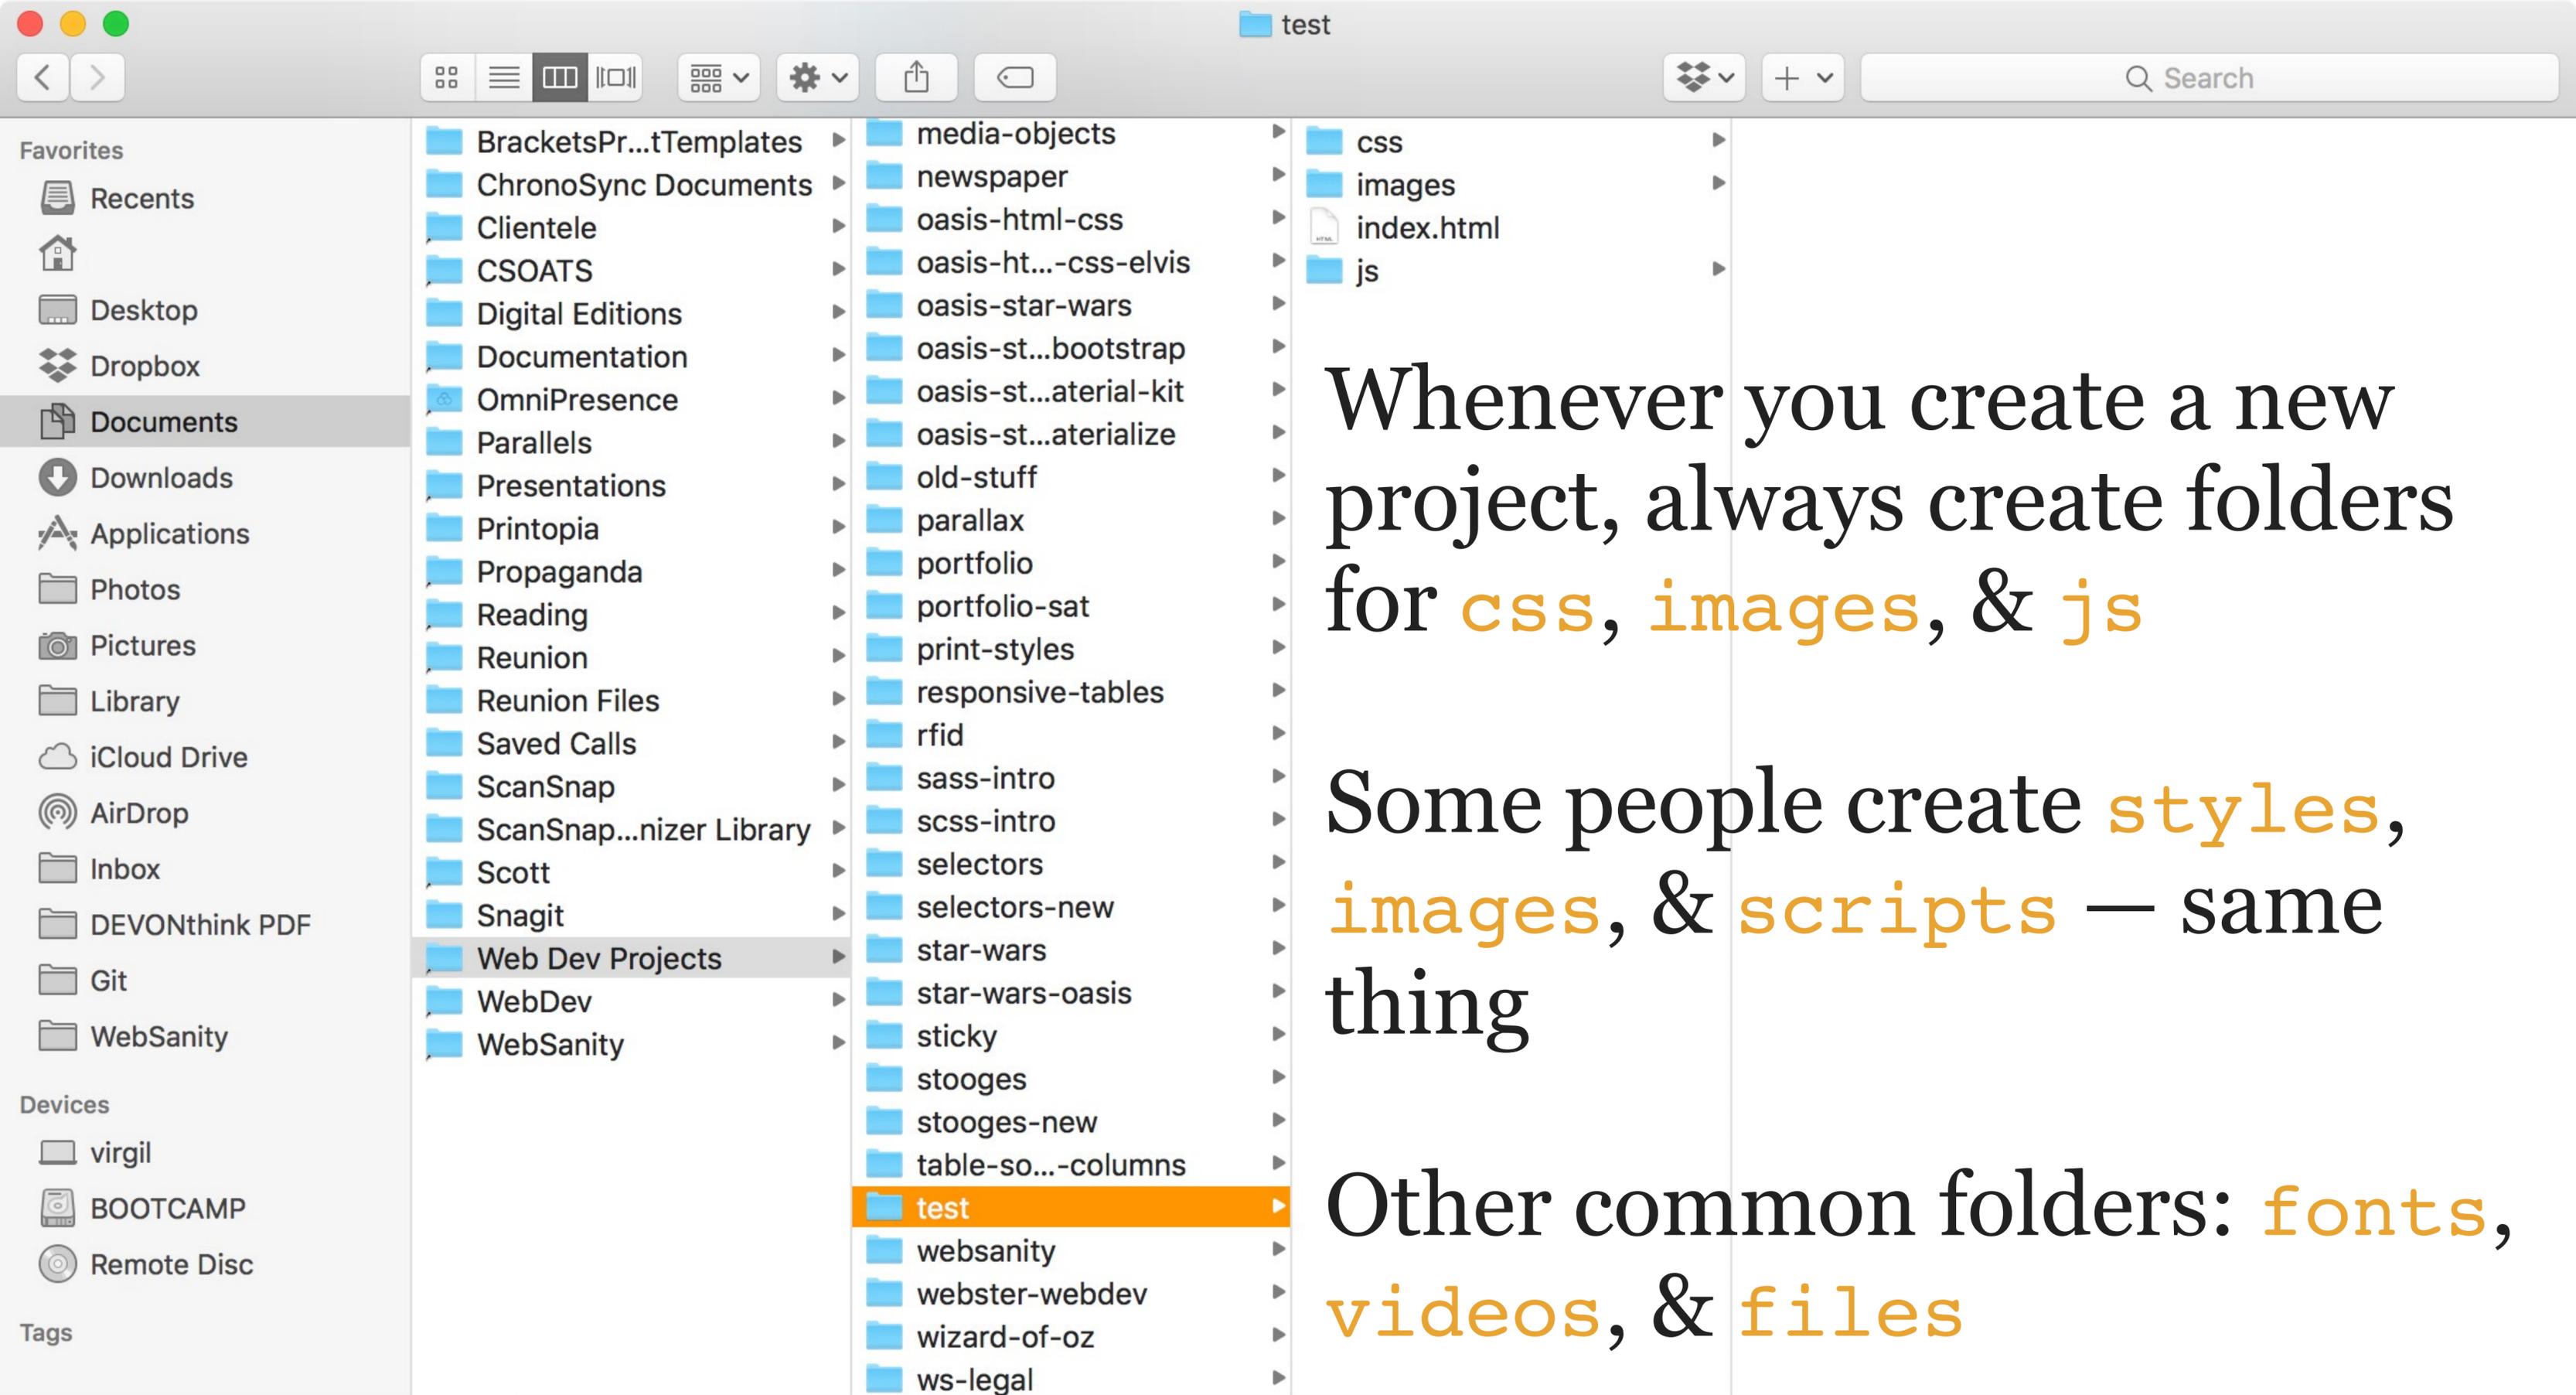

Or use *character entities* (covered later):

```
<img alt="Cthulhu says &ldquo;This is tasty!  
&rdquo;" ">
```

# FORMATTING GUIDE

Be careful with using quotation marks inside a `value` in every `attribute="value"` pair for every element

 PRO TIP

When you're developing your website, you will often need temporary placeholder images

# Unsplash

The internet's source of freely-usable images.  
Powered by creators everywhere.

Trending: flower, wallpapers, backgrounds, happy, love

# Includes random images, grayscale, & blurring

## Lorem Picsum

Lorem Ipsum... but for photos

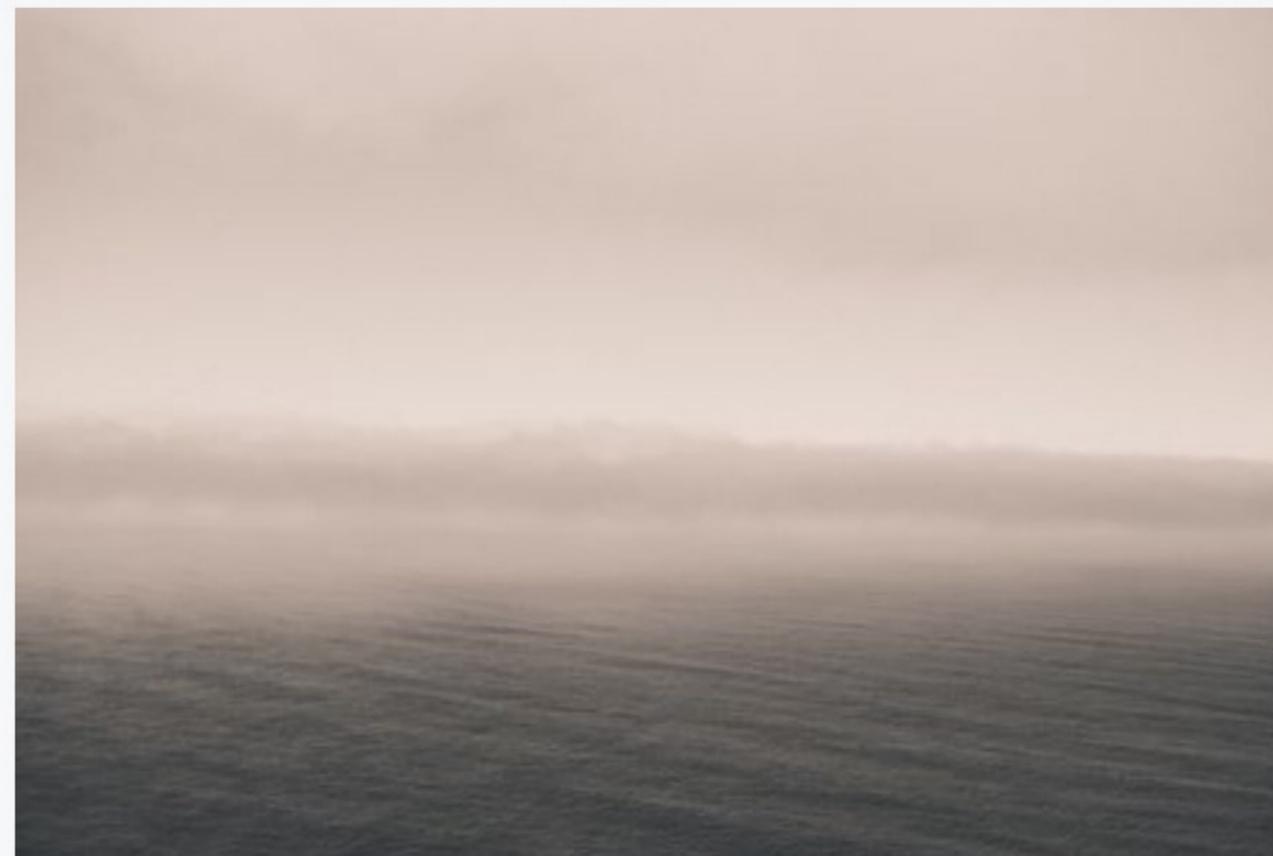

## Basic Usage

Just put your image size (width & height) after our URL and you'll get a placeholder.

```
https://picsum.photos/200/300
```

To get a square image, just put the size you want.

```
https://picsum.photos/200
```

# Dynamic Dummy Image Generator

Allows you to offer alternative versions of an image to support responsive design

Covered later in *Responsive Design*

					ios		
<picture>	—	13	38	9.1	9.3	38	Y

```
<video> ... </video>
```

Allows the browser to *play video*, completely obsoleting the need to use Flash or other plugins

# Attributes

- » `width & height`
- » `src=" [URL ] "`: if multiple, use `<source>` instead
- » `controls`: Show play, stop, & other controls
- » `autoplay`: No!
- » `muted`: Not normally a good idea (default is `false`)
- » `loop`: No!
- » `preload=" auto "`: Video downloaded in background (Yes!)
- » `poster=" action.png "`: Display image before video loads

On mobile browsers, `preload="auto"` never works

On mobile browsers, `autoplay` & `muted` are conditional

For `autoplay` to work, you must either set `muted` or lack an audio track

Supported browsers:

- » Chrome on Android 55+
- » Mobile Safari 10+

```
1 <video controls="controls" poster="http://files.granneman.com/interviews/2010-0518-KMOV-News-4.png"  
  src="http://files.granneman.com/interviews/2010-0518-KMOV-News-4.mp4" width="640" height="360">  
2 </video>
```

`<source>`

Enables authors to specify *multiple media resources* for  
`<video>` & `<audio>`

Does nothing on its own

Always a child of `<video>` & `<audio>`

No `</source>`!

`type`

Attribute *specifying MIME/media type of the resource*, optionally with a codecs parameter

In other words

```
<source src="foo.mp4" type="video/mp4">
```

## SIDE NOTE

What's a *MIME type*?

Originally defined in 1996 as the MIME (*Multipurpose Internet Mail Extensions*) specification for identifying types of email message content & attachments

Now just called *media types*

## SIDE NOTE

Always specified as `type/subtype`

Allowed types: `application`, `audio`, `example`, `font`, `image`, `message`, `model`, `multipart`, `text`, & `video`

Examples:

- » `application/pdf`
- » `audio/mp3`
- » `image/jpeg`
- » `text/css`
- » `video/mp4`

# Incomplete list of MIME types

Languages

Edit

[Web technology for developers](#) >  
[HTTP](#) > [Basics of HTTP](#) >  
[MIME types](#) >  
Incomplete list of MIME types

Here is a list of MIME types, associated by type of documents, ordered by their common extensions.

Two primary MIME types are important for the role of default types:

- `text/plain` is the default value for textual files. A textual file should be human-readable and must not contain binary data.
- `application/octet-stream` is the default value for all other cases. An unknown file type should use this type. Browsers pay a particular care when manipulating these files, attempting to safeguard the user to prevent dangerous behaviors.

IANA is the official registry of MIME media types and maintains a [list of all the official MIME types](#). This table lists some important MIME types for the Web:

### Registration Procedure(s)

Expert Review for Vendor and Personal Trees.

### Expert(s)

Ned Freed, Murray Kucherawy

### Reference

[\[RFC6838\]](#)[\[RFC4855\]](#)

### Note

Per Section 3.1 of [\[RFC6838\]](#), Standards Tree requests made through IETF documents will be reviewed and approved by the IESG, while requests made by other recognized standards organizations will be reviewed by the Designated Expert in accordance with the Specification Required policy. IANA will verify that this organization is recognized as a standards organization by the IESG.

### Note

[\[RFC2046\]](#) specifies that Media Types (formerly known as MIME types) and Media Subtypes will be assigned and listed by the IANA.

Procedures for registering Media Types can be found in [\[RFC6838\]](#), [\[RFC4289\]](#), and [\[RFC6657\]](#). Additional procedures for registering media types for transfer via Real-time Transport Protocol (RTP) can be found in [\[RFC4855\]](#).

The following is the list of Directories of Content Types and Subtypes. If you wish to register a Media Type with the IANA, please see the following for the online application:

[\[Application for registration of Media Types\]](#)

Other Media Type Parameters: [\[IANA registry media-types-parameters\]](#)

Media Type Sub-Parameters: [\[IANA registry media-type-sub-parameters\]](#)

### Available Formats

XML

HTML

Plain text

Registries included below

If you leave `type` out...

1. Rendering engine queries server for media's type, checks to see if it can play the type, & then does if it can
2. If rendering engine cannot play the type, it checks the next `<source>` & repeats step 1

If you specify a value for `type`...

1. Rendering engine checks to see if it can play the type & then does if it can
2. If rendering engine cannot play the type, the server is *not* queried & it checks the next `<source>` & repeats step 1

Therefore...

- » always include `type` to reduce server calls
- » the order of your `<source>` elements matter

```
1 <video controls="controls"  
  poster="http://files.granneman.com/interviews/  
  /2010-0518-KMOV-News-4.png" width="640"  
  height="360">  
2   <source  
  src="http://files.granneman.com/interviews/  
  2010-0518-KMOV-News-4.mp4 "  
  type="video/mp4">  
3   <source  
  src="http://files.granneman.com/interviews/  
  2010-0518-KMOV-News-4.webm"  
  type="video/webm">  
4   <source  
  src="http://files.granneman.com/interviews/  
  2010-0518-KMOV-News-4.ogv"  
  type="video/ogg">  
5 </video>
```

The code here is wrapping; note that **source**, **src**, & **type** are all on one line!

```
1 <video controls="controls" poster="http://files.granneman.com/interviews/2010-0518-KMOV-News-4.png"  
width="640" height="360">

4   <source src="http://files.granneman.com/interviews/2010-0518-KMOV-News-4.ogv" type="video/ogg">  
5 </video>
```

Only 1 video file/format? Use the `src` attribute

```
<video src="/videos/cthulhu.mp4">
```

2 or more video files/formats? Use `<source>`

```
<video>  
  <source src="/videos/cthulhu.mp4">  
  <source src="/videos/cthulhu.webm">  
</video>
```

`<track>`

Enables authors to specify *multiple timed text resources* for `<video>` & `<audio>`

Does nothing on its own

Always a child of `<video>` & `<audio>`

No `</track>`!

## 5 kinds of text tracks:

- » **subtitles**: translation + extra background info
- » **captions**: transcription + sound effects for deaf viewers
- » **descriptions**: narration of content for blind users
- » **chapters**: titles for navigating the content
- » **metadata**: for use by scripts, so not visible to users

## Attributes

- » **src**: link to file that is either *Web Video Timed Text* (WebVTT) or *Timed Text Markup Language* (TTML)
- » **srcLang**: language of the **src** file, e.g., **en**, **es**, **fr**
- » **kind**: type of text content, e.g., **subtitles** or **captions**
- » **label**: text displayed to a user selecting a track
- » **default**: enables a single **<track>** automatically

# Sample WebVTT (`file-name.vtt`) file:

## WEBVTT

1

00:00:01.000 --> 00:00:08.000

This is the first line of text,  
displaying from 1-8 seconds

2

00:00:09.000 --> 00:00:20.000

This is the second chunk of text

```
1 <video controls="controls"  
  poster="https://s3-us-west-  
  2.amazonaws.com/s.cdpn.io/122116/2010-

Adapter

[www.macroplant.com/adapter/](http://www.macroplant.com/adapter/)

Video conversion software

```
<audio> ... </audio>
```

Allows the browser to *play audio* without Flash or other plugins

## Attributes

- » `src=" [URL ] "`: if multiple, use `<source>` instead
- » `controls`: Show play, stop, & other controls
- » `autoplay`: No!
- » `muted`: Not normally a good idea (default is `false`)
- » `loop`: Repeat audio—only use if necessary!
- » `preload="auto"`: Audio downloaded in background (Yes!)

On mobile browsers, the following `<audio>` attributes are not supported:

- » `autoplay`
- » `muted`
- » `preload="auto"`

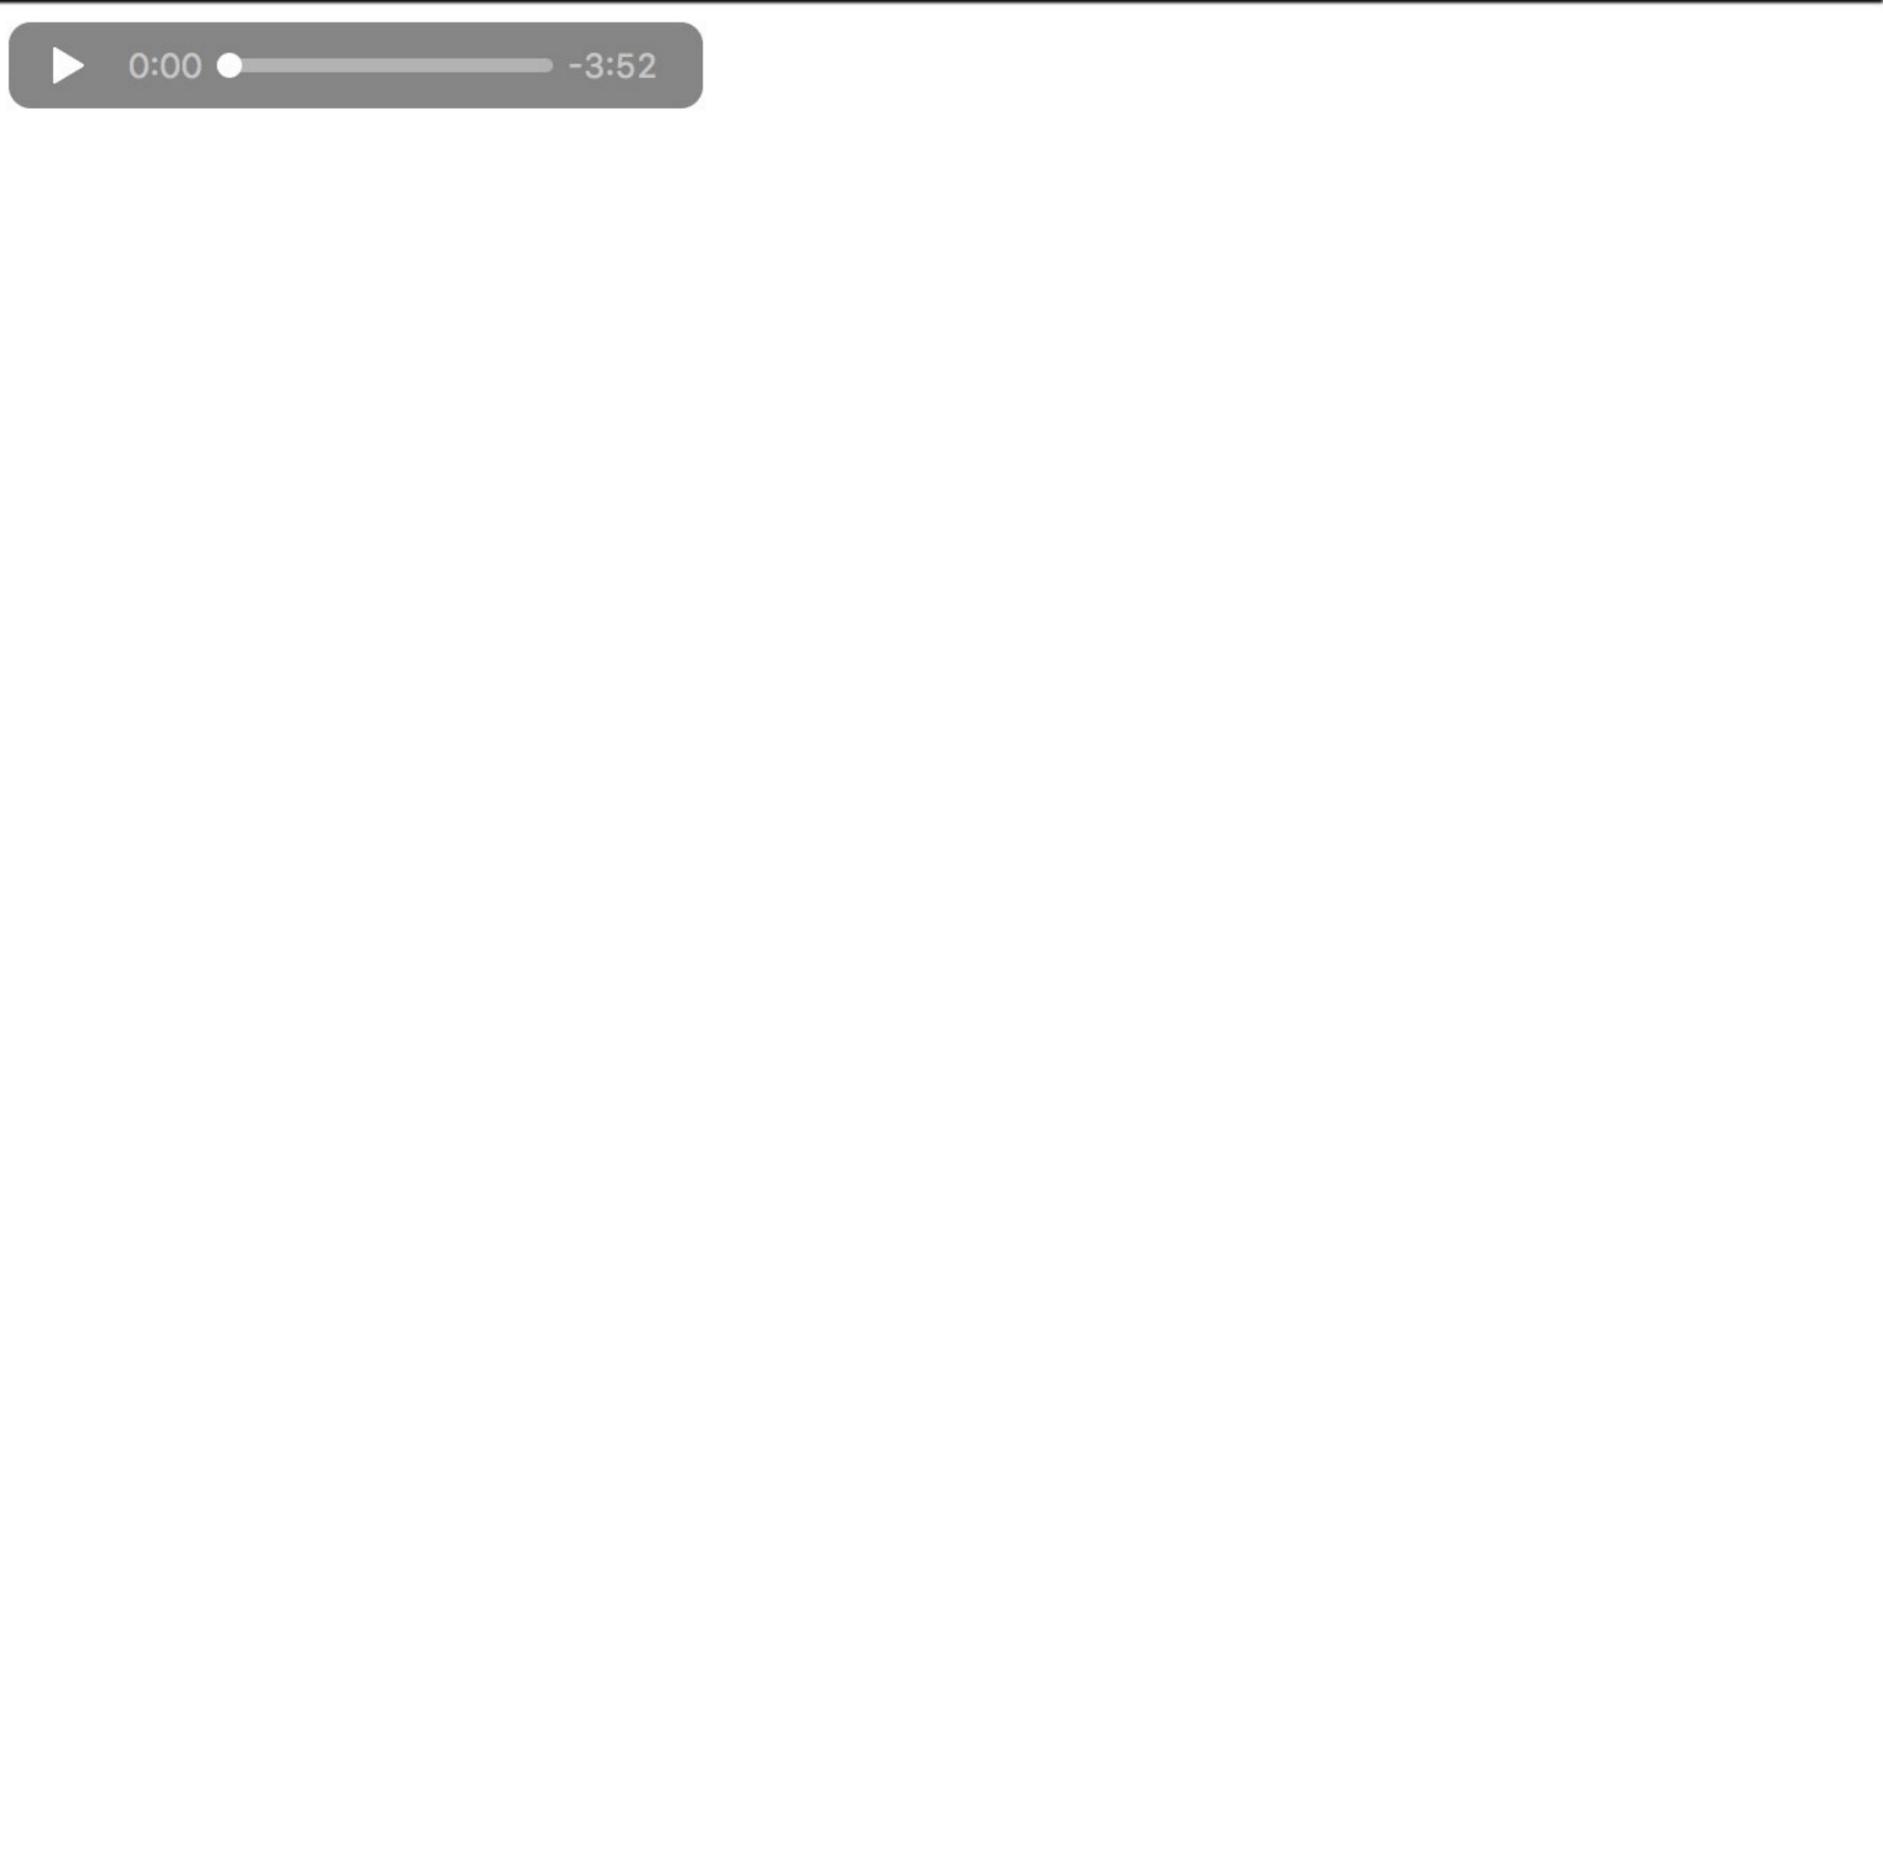

⚙ HTML

```
1 <audio controls preload="auto" autobuffer  
  src="http://files.granneman.com/interviews/  
  2004-0630-Future-Tense.mp3">  
2 </audio>
```

⚙ CSS

⚙ JS

0:00 -3:52

Don't forget you can also use `<source>` & `<track>`

```
1 <audio controls preload="auto" autobuffer>
2   <source
3     src="http://files.granneman.com/interviews/
4       2004-0630-Future-Tense.mp3">
5   <source
6     src="http://files.granneman.com/interviews/
7       2004-0630-Future-Tense.ogg">
8 </audio>
```

Audio conversion software

# FORMATTING GUIDE

```
<p>  
  <video ...>  
    <track ...>  
  </video>  
</p>
```

Never surround `<video>` & `<audio>` with `<p>`

---

```
<video ...>  
  <track ...>  
</video>
```

				iOS		
<video>	9	3.5	3.1	3.1	3	2.3
<audio>	9	3.5	3.1	4	3	2.3
<source>	9	3.5	3.1	Y	Y	Y
<track>	10	31	6	7	23	25

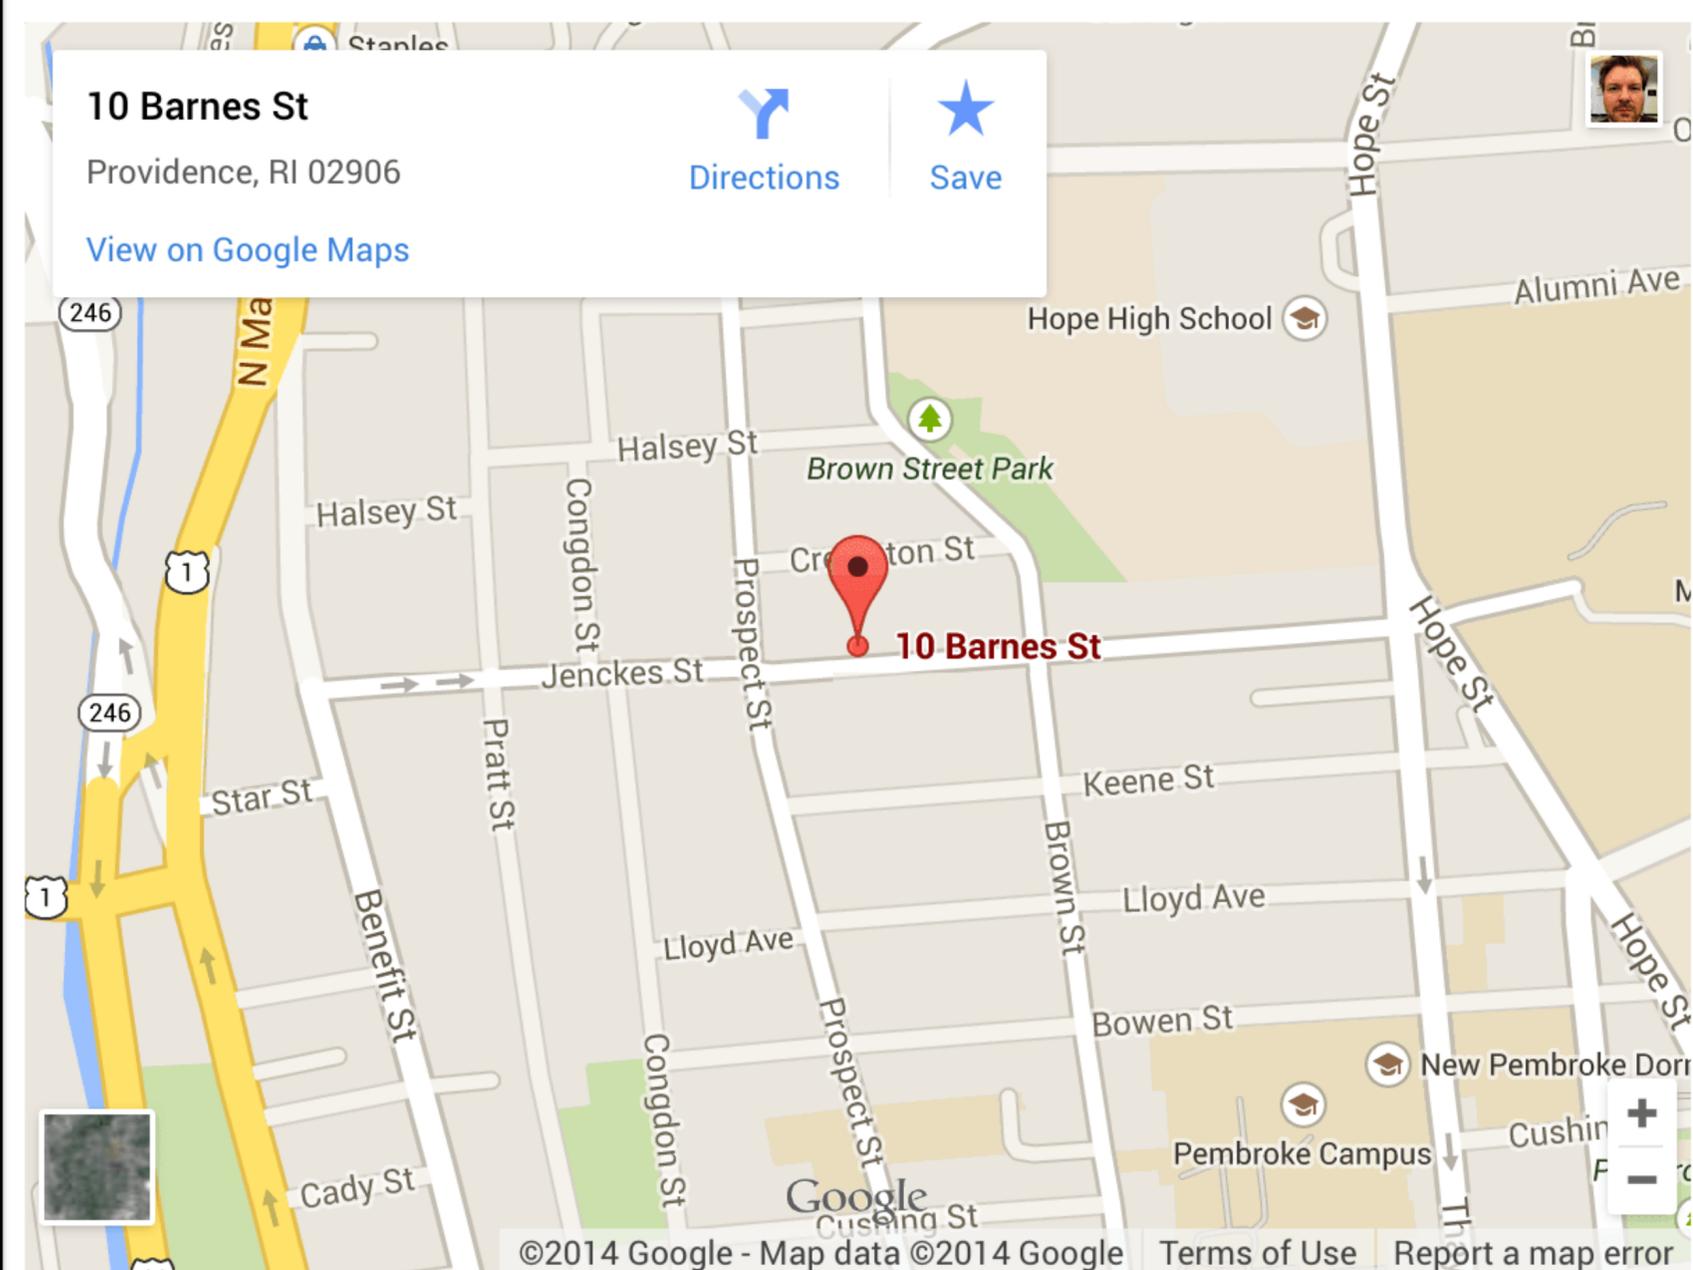

```
<iframe> ... </iframe>
```

*Internal frame*: embeds another webpage inside the current webpage

`src` attribute is required

2 attributes should instead be handled using CSS:  
`width` (default is `300px`) & `height` (default is `150px`)

```
1 <iframe
  src="https://www.google.com/maps/embed?
  pb=!1m17!1m11!1m3!1d2972.7925037011373!2d
  -
  71.405474!3d41.832766000000014!2m2!1f0!2f
  0!3m2!1i1024!2i768!4f13.1!3m3!1m2!1s0x89e
  4452202b2d2ed%3A0x85a79d56cdc815c2!2s10+B
  arnes+St!5e0!3m2!1sen!2sus!4v139887481779
  4" width="600" height="450"
  frameborder="0" style="border:0">
</iframe>
```

A good thing: the embedded webpage in an `<iframe>` can be updated without reloading the container page

A caveat: the container webpage's CSS & JavaScript cannot affect the embedded webpage in an `<iframe>` (but this is good!)

`<iframe>` security is a big deal, so several attributes focus on that

- » `allow`: Specifies a feature policy
- » `sandbox`: Applies extra restrictions to the content in the frame
- » `csp`: A Content Security Policy enforced for the embedded resource
- » `referrerpolicy`: Indicates which referrer to send when fetching the frame's resource

## srcdoc

Instead of a link to a document, *specifies inline HTML* to show

Overrides `src` attribute — if the browser doesn't support `srcdoc`, it falls back to the URL in `src`

Must encode any quotation marks inside `srcdoc`'s value using `&quot;`; (see *Character Entities* later)

# HTML

```
1 <iframe src="https://www.google.com/maps/embed?
pb=!1m17!1m11!1m3!1d2972.7925037011373!2d-

</p>"</iframe>
```

[Open in your device's Maps app](#)

# CSS

# JS

							
<code>srcdoc</code>	—	79	25	6	6	20	25

## SIDE NOTE

There is a much older feature called Frames which uses `<frameset>` & `<frame>`

MDN: “Avoid using it, and update existing code if possible; see the compatibility table at the bottom of this page to guide your decision. Be aware that this feature may cease to work at any time.”

Don't use those elements!

And besides, Frames sucked anyway

`<object> ... </object>`

Embedded *external resource*; e.g., image, plugin, SVG

For standard multimedia, only use if `<video>` or `<audio>` won't work

Must use with SVG to be fully parsed for links, animations, JavaScript

May need 1 or more `<param>` elements

# Attributes

- » `data:` (required)
- » `type:` (required)
- » `width & height`

<param>

Defines *parameters* used by <object>

Need to use the *name* & *value* attributes

HTML

```
1 <object type="application/x-shockwave-flash"
  data="http://releases.flowplayer.org/swf/flowp
  layer-3.2.1.swf" width="640" height="360">
2   <param name="movie"
  value="http://releases.flowplayer.org/swf/fl
  owplayer-3.2.1.swf">
3   <param name="allowFullScreen" value="true">
4   <param name="wmode" value="transparent">
5   <param name="flashVars" value="config=
  {'playlist':
  ['http%3A%2F%2Ffiles.granneman.com%2Fintervi
  ews%2F2010-0518-KMOV-News-4.png',
  {'url':'http%3A%2F%2Ffiles.granneman.com%2Fi
  nterviews%2F2010-0518-KMOV-News-
  4.mp4','autoPlay':false}]]">
6   
7 </object>
```

CSS

JS

`<embed>`

Integrates *external applications or interactive content*  
(in other words, *non-HTML plug-ins*)

No fallback content

No `</embed>`!

`<embed>` is mostly around for historical reasons, so use  
`<video>`, `<audio>`, or `<object>` instead

Tables

<table>

<caption>

<thead>, <tfoot>, <tbody>

<colgroup> & <col>

<tr>

Interactivity

<details> & <summary>

<dialog>

```
<details> ... </details>
```

Represents a “disclosure widget” that *allows users to obtain additional info or controls*

First child must be `<summary>`, which the user sees, & then followed by text (if you leave out `<summary>`, most browsers will use `Details` as the label)

```
<summary> ... </summary>
```

Specifies a summary, caption, or legend for a `<details>` disclosure box

Clicking `<summary>` toggles the parent `<details>` open & closed

Only use for `<summary>` is inside `<details>`

`<summary>` can only contain:

» `<h1>`—`<h6>`

» plain text

» HTML that can be used within a `<p>`

```
HTML

## 💡 PRO TIP

Default styles for `<summary>` includes `display: list-item`, which allows you to change or remove the disclosure triangle icon that indicates closed or open

You can also remove the disclosure triangle if you change the style to `display: block`

```
<dialog> ... </dialog>
```

Displays a *dialog box* or *other interactive component*, such as a dismissable alert, inspector, or subwindow

Requires CSS & JavaScript to really do anything

Covered in *For Developers Only*

Scripting

<script>

<noscript>

<canvas>

## SIDE NOTE

These scripting elements are covered elsewhere

Web Components: `<template>` & `<slot>`

```
<script> ... </script>
```

Embeds or references *executable script* in the document

Embedding reduces outbound requests, an example of *resource inlining*

If **type** attribute is absent, browser assumes JavaScript

If referenced, **src** attribute is required

```
1 <h3>Embedded JavaScript</h3>
2
3 <p>
4   Let's hope Cthulhu doesn't wake up in
   <script
     type="text/javascript">document.write
     (new Date().getFullYear());</script>
   & doom us all.
5 </p>
6
7 <h3>Referenced JavaScript</h3>
8
9 <p>
10  Let's hope Cthulhu doesn't wake up in
    <script
      src="http://codepen.websanity.com/js/
      year.js"></script> & doom us all.
11 </p>
```

## Embedded JavaScript

Let's hope Cthulhu doesn't wake up in 2014 & doom us all.

## Referenced JavaScript

Let's hope Cthulhu doesn't wake up in 2014 & doom us all.

```
<noscript> ... </noscript>
```

*Alternate content* when `<script>` is not executed

If `<noscript>` is in `<head>`, can only contain `<link>`,  
`<style>`, or `<meta>`

If `<noscript>` is in `<body>`, can contain content

```
1 <noscript>
2   <p>
3     <strong>Please turn on JavaScript,
4     or Cthulhu will be angry.</strong>
5   </p>
6 </noscript>
7 <p>
8   Let's hope Cthulhu doesn't wake up in
9   <script
10  type="text/javascript">document.write
11  (new Date().getFullYear());</script>
12  & doom us all.
13 </p>
```

**Please turn on JavaScript, or Cthulhu will be angry.**

Let's hope Cthulhu doesn't wake up in & doom us all.

`<canvas> ... </canvas>`

A resolution-dependent *bitmap canvas* that is used for drawing graphics on the fly using JavaScript

`<canvas>` is *raster-based*, while SVG is *vector-based*

Used for:

- » graphs
- » game graphics
- » art
- » visual images
- » photo compositions
- » animations
- » & much more!

Sizing via CSS can cause distortion, so better to use the `width` & `height` attributes

Unless you're creating a responsive webpage...

What about `height` & `width` on a responsive webpage?

1. Don't use `width` & `height` attributes on `<canvas>`
2. In CSS, set `width: 100%` for the `<canvas>`
3. Using JavaScript, set the `height` to some ratio of the `width`

```
var canvas =  
    document.getElementById( 'responsive-canvas' );  
var heightRatio = 1.5;  
canvas.height = canvas.width * heightRatio;
```

Can provide alternate content inside `<canvas>` for older rendering engines & those with JavaScript disabled

```
<canvas width="640" height="480">  
  Time to get a real browser!  
</canvas>
```

## Advantages of `<canvas>`

- » Interactivity via keyboard, mouse, or touch
- » Animation of all objects
- » Flexibility in what can be created
- » Supported by all major desktop & mobile rendering engines
- » Programmable!

Software you can use to create `<canvas>`

- » Adobe ~~Flash~~ Animate
- » Adobe Illustrator
- » Adobe After Effects + bodymovin extension
- » Tumult Hype
- » Google Web Designer
- » Construct 2 (games)

Magazine for designers and web developers

# Character References

You might see these in some code

`&amp;`

`&copy;`

`&quot;`

`&nbsp;`

Those are *character entities* or *named references*

Before UTF-8 was available, there was no easy way to enter a © or ¢ or — in your HTML

You had to use HTML character entities

HTML 1	3 ( <code>amp</code> , <code>lt</code> , <code>gt</code> )
--------	--

HTML 2	63
--------	----

HTML 3.2	34
----------	----

HTML 4	153
--------	-----

HTML5	1258 new + 84 additions to earlier ones (For example, <code>gt</code> was defined in HTML 1, but in HTML5 <code>GT</code> was added)
-------	---

HTML versions & character entities introduced

All character entities...

- » begin with &
- » end with ;

Contents are case-sensitive letters, along with numbers in a few cases

<code>&amp;copy;</code>	©	<code>&amp;sect;</code>	§	<code>&amp;ouml;</code>	ö
<code>&amp;trade;</code>	™	<code>&amp;para;</code>	¶	<code>&amp;Eacute;</code>	É
<code>&amp;quot;</code>	"	<code>&amp;frac14;</code>	¼	<code>&amp;eacute;</code>	é
<code>&amp;ldquo;</code>	“	<code>&amp;mdash;</code>	—	<code>&amp;divide;</code>	÷
<code>&amp;rdquo;</code>	”	<code>&amp;lt;</code>	<	<code>&amp;middot;</code>	•
<code>&amp;hellip;</code>	...	<code>&amp;gt;</code>	>	<code>&amp;check;</code>	✓

Character entities use letters as mnemonics

In addition to character entities, which use letters, you can also represent Unicode code points using numbers, in either *decimal* or *hexadecimal* form

These still start with `&` & end with `;`

&#169;	©	&#167;	§	&#246;	ö
&#8482;	™	&#182;	¶	&#201;	É
&#34;	"	&#188;	¼	&#233;	é
&#8220;	“	&#8212;	—	&#247;	÷
&#8221;	”	&#60;	<	&#183;	•
&#8230;	...	&#62;	>	&#10003;	✓

Decimal numbers

# Numerical systems

Humans use *base 10*: 0–9

Computers use *base 2 (binary)*: 0 & 1

*Hexadecimal* uses base 16: 0–F (0–9, then A–F)

The letters in hex are *not* case sensitive

**& is 0026 • M is 004D • @ is 0040 • T is 0054 • z is 007A • ~ is 007E**

	0x00	0x01	0x02	0x03	0x04	0x05	0x06	0x07	0x08	0x09	0x0A	0x0B	0x0C	0x0D	0x0E	0x0F
0x0																
0x10																
0x20		!	"	#	\$	%	&	'	(	)	*	+	,	-	.	/
0x30	0	1	2	3	4	5	6	7	8	9	:	;	<	=	>	?
0x40	@	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O
0x50	P	Q	R	S	T	U	V	W	X	Y	Z	[	\	]	^	_
0x60	`	a	b	c	d	e	f	g	h	i	j	k	l	m	n	o
0x70	p	q	r	s	t	u	v	w	x	y	z	{		}	~	

Unicode Block: Basic Latin

# Unicode Block: Arrows

© is `&#169;` in decimal

© is `&#x00a9;` or `&#xa9;` (you don't need the `00` at the beginning) in hexadecimal

Remember, © had Unicode code point `00a9`

The lowercase `x` tells the browser you're about to give it a Unicode code point in hexadecimal

&#xA9;	©	&#xA7;	§	&#xF6;	ö
&#x2122;	™	&#xB6;	¶	&#xC9;	É
&#x22;	"	&#xBC;	¼	&#xE9;	é
&#x201C;	“	&#x2014;	—	&#xF7;	÷
&#x201E;	”	&#x3C;	<	&#xB7;	•
&#x2026;	...	&#x3E;	>	&#x2713;	✓

Hexadecimal points to positions in Unicode blocks

	<	©	&	é
Named	<code>&amp;lt;</code>	<code>&amp;copy;</code>	<code>&amp;amp;</code>	<code>&amp;eacute;</code>
Decimals	<code>&amp;#60;</code>	<code>&amp;#169;</code>	<code>&amp;#38;</code>	<code>&amp;#233;</code>
Hex	<code>&amp;#x3C;</code>	<code>&amp;#xA9;</code>	<code>&amp;#x26;</code>	<code>&amp;#xE9;</code>

Character entities are easier to remember, but there are far more numbers

				
	Quarter note	White chess queen	Place of interest sign	Pile of poo
Named				
Decimals	<code>&amp;#9833;</code>	<code>&amp;#9813;</code>	<code>&amp;#8984;</code>	<code>&amp;#128169;</code>
Hex	<code>&amp;#x2669;</code>	<code>&amp;#x2655;</code>	<code>&amp;#x2318;</code>	<code>&amp;#x1f4a9;</code>

No character entities for these — numbers only

```
1 <p>
2   &copy; 2014 Cthulhu Inc.
3 </p>
4
5 <p>
6   &quot;Hi, Nyarlathotep!&quot;;
7 </p>
8
9 <p>
10  &ldquo;Herrre, Shoggy Shoggy
11   Shoggoth!&rdquo;;
12 </p>
13 <p>
14   Don't eat me&mdash;eat him!
15 </p>
16
17 <p>
18   Pabodie, Lake, Atwood &amp; Dyer
19 </p>
20
21 <p>
22   Charles&nbsp;Dexter&nbsp;Ward
23 </p>
```

© 2014 Cthulhu Inc.

"Hi, Nyarlathotep!"

“Herrre, Shoggy Shoggy Shoggoth!”

Don't eat me—eat him!

Pabodie, Lake, Atwood & Dyer

Charles Dexter Ward

`&nbsp;` is a *non-breaking space*

It glues words together so they can't be split apart

```
1 <p>
2   Resize the browser window slowly & notice
   where & when "Herbert West" wraps.
3 </p>
4
5 <h3>Without &nbsp;</h3>
6
7 <p>
8   Meet my good friend—the esteemed young Dr.
   Herbert West.
9 </p>
10
11 <h3>With &nbsp;</h3>
12
13 <p>
14   Meet my good friend—the esteemed young Dr.
   Herbert&nbsp;West.
15 </p>
```

Resize the browser window slowly & notice where & when "Herbert West" wraps.

### Without &nbsp;

Meet my good friend—the esteemed young Dr. Herbert West.

### With &nbsp;

Meet my good friend—the esteemed young Dr. Herbert West.

Unfortunately, before CSS, developers figured out ways to mis-use `&nbsp;`; to insert multiple spaces without the monospaced fonts of `<pre>`

Do not mis-use the `&nbsp;` character entity!

It's a terrible hack

It's not semantic

It complicates code

It breaks CSS

Use CSS instead!

# List of XML and HTML character entity references

From Wikipedia, the free encyclopedia

In SGML, HTML and XML documents, the logical constructs known as *character data* and *attribute values* consist of sequences of characters, in which each character can manifest directly (representing itself), or can be represented by a series of characters called a *character reference*, of which there are two types: a *numeric character reference* and a **character entity reference**. This article lists the character entity references that are valid in HTML and XML documents.

A character entity reference refers to the content of a named entity. An entity declaration is created by using the `<!ENTITY name "value">` syntax in a Document Type Definition (DTD).

## Unicode Blocks

### Summary

The Unicode standard arranges groups of characters together in blocks. This is the complete list of blocks.

### Detail

Name	From	To	# Codepoints
<a href="#">Basic Latin</a>	U+0000	U+007F	(128)
<a href="#">Latin-1 Supplement</a>	U+0080	U+00FF	(128)
<a href="#">Latin Extended-A</a>	U+0100	U+017F	(128)
<a href="#">Latin Extended-B</a>	U+0180	U+024F	(208)
<a href="#">IPA Extensions</a>	U+0250	U+02AF	(96)
<a href="#">Spacing Modifier Letters</a>	U+02B0	U+02FF	(80)
<a href="#">Combining Diacritical Marks</a>	U+0300	U+036F	(112)

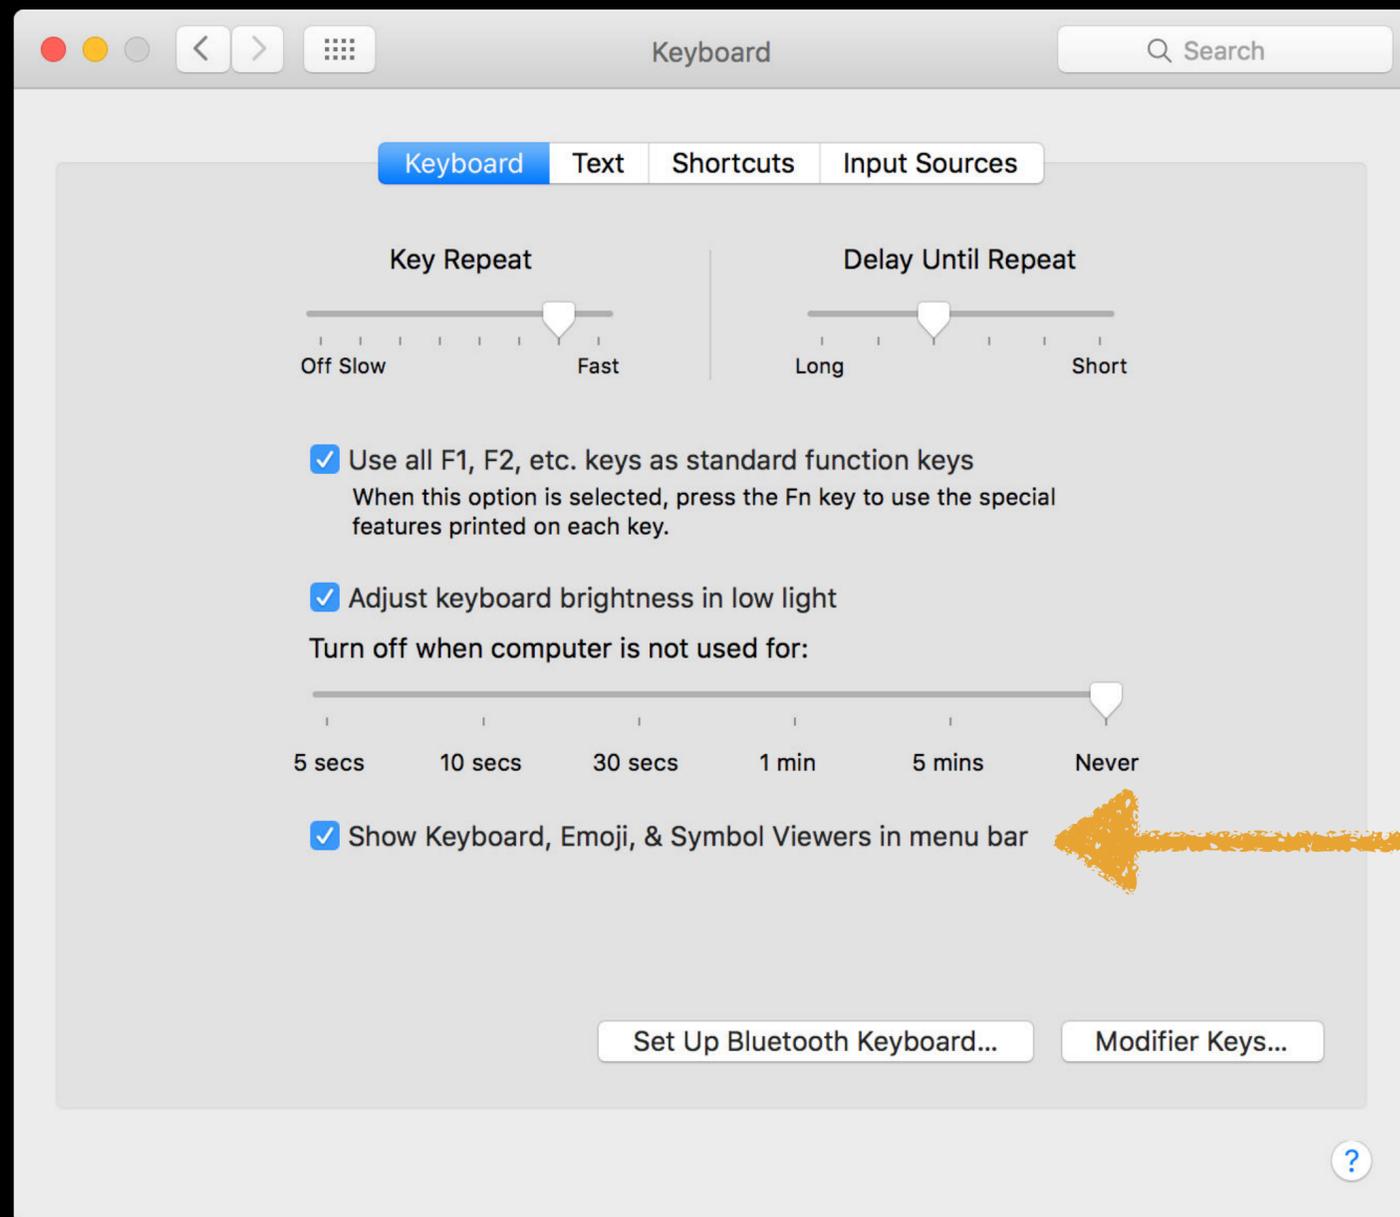

Even with UTF-8, you still have to use these 3 character entities

<code>&amp;lt;</code>	<
<code>&amp;amp;</code>	&
<code>&amp;nbsp;</code>	[non-breaking space]

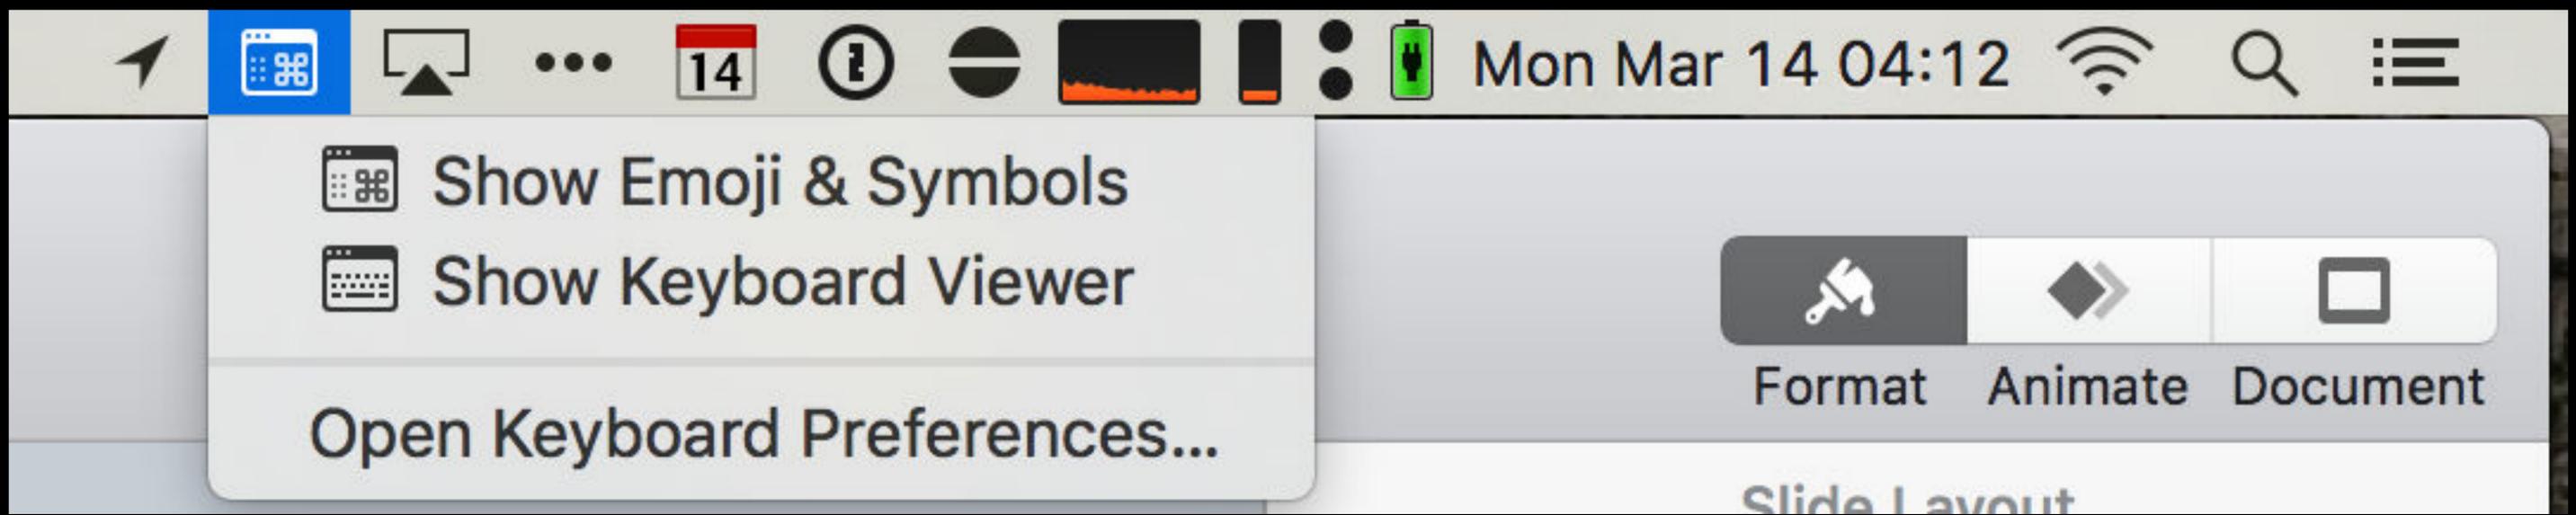

Just type in all other characters

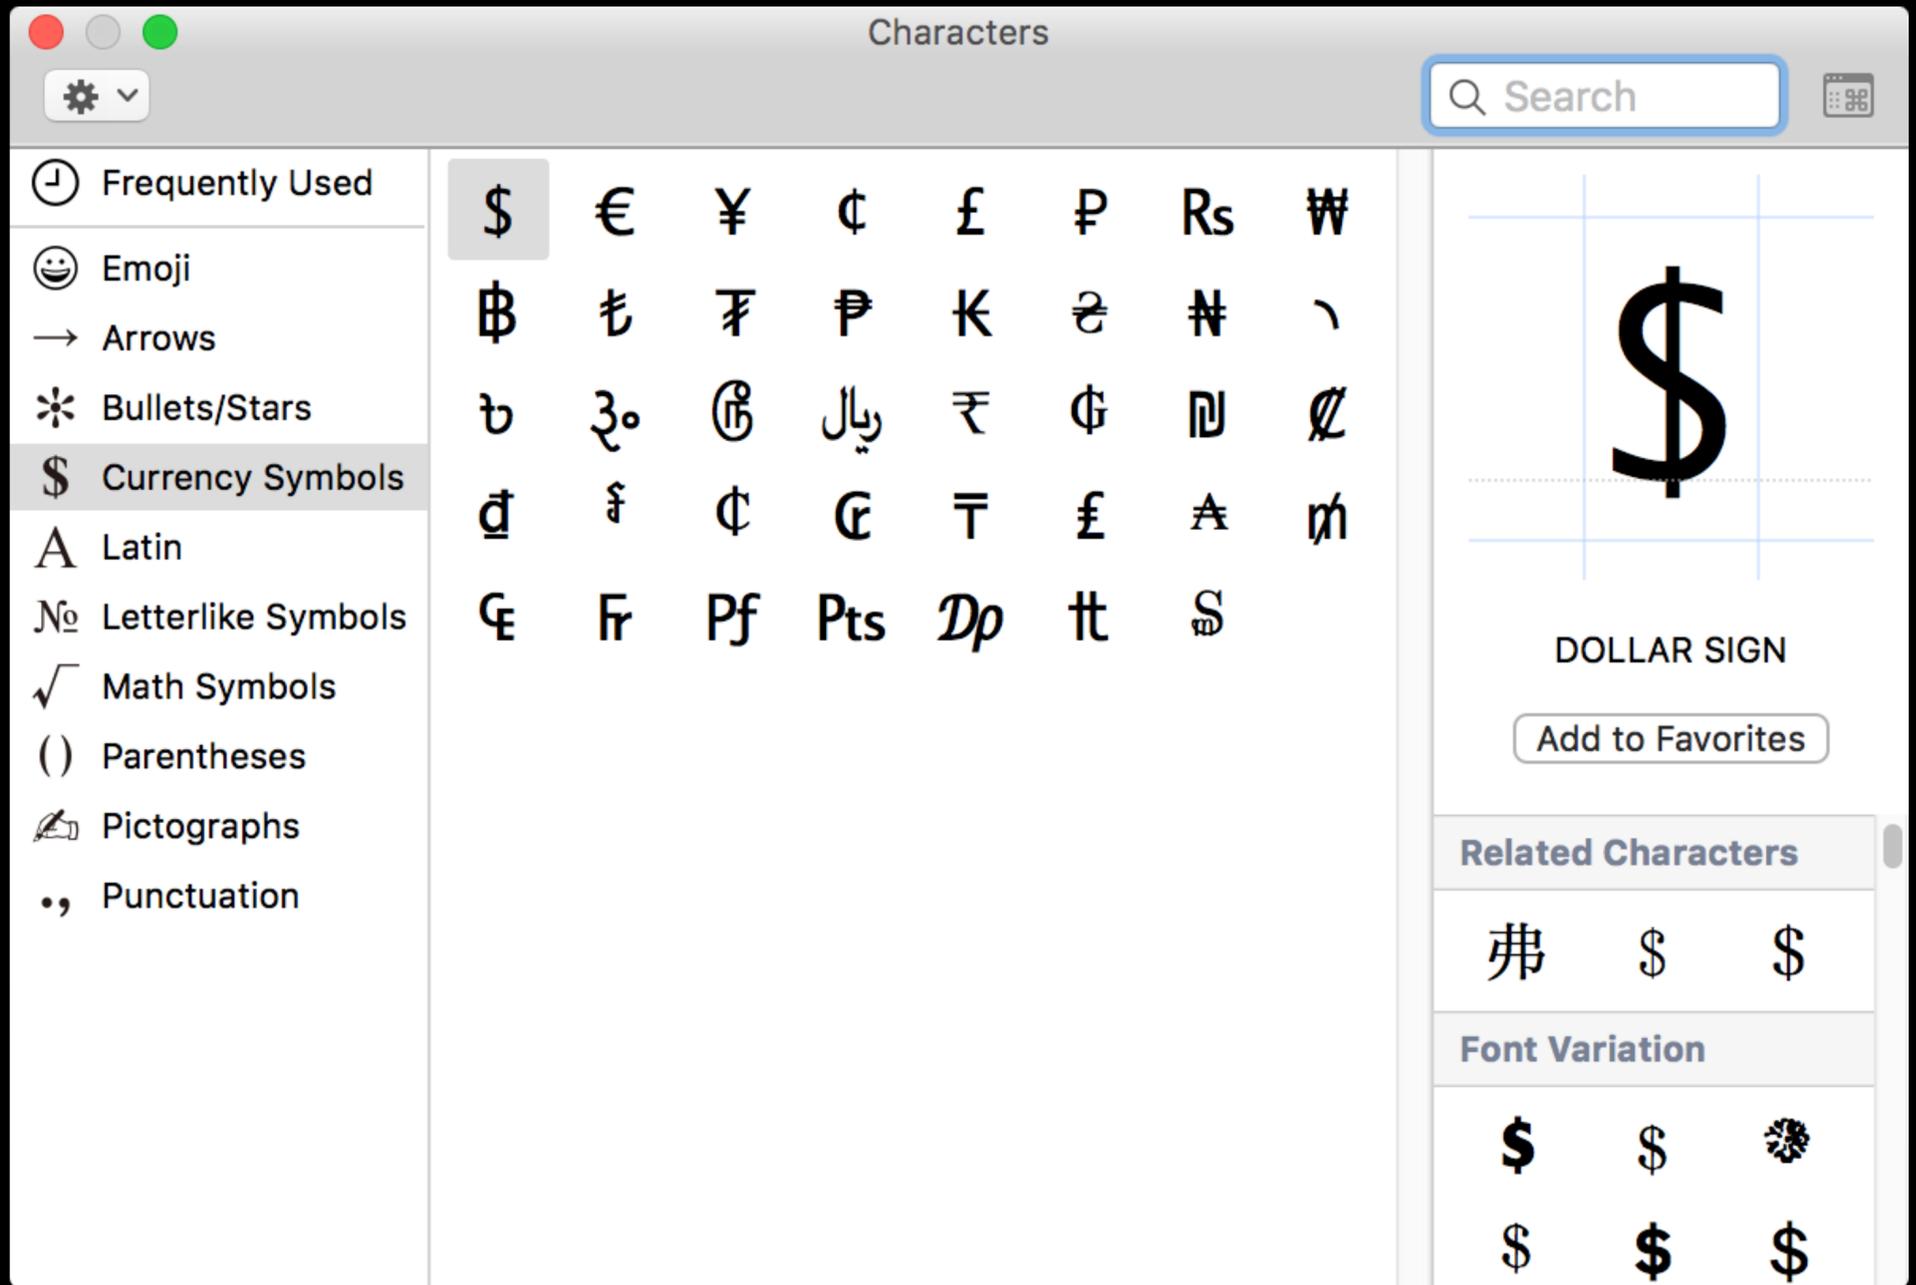

🍏 > System Preferences > Keyboard > Keyboard

[What does this mean?](#)

# Support for older versions of Internet Explorer ends on January 12, 2016

[Upgrade now](#)

**“After January 12, 2016, Microsoft will no longer provide security updates or technical support for older [pre-11] versions of Internet Explorer.”**

[What is end of support?](#)

[What does this mean?](#)

IE 9 & below does not adequately support HTML5

(surprise!)

There are ways to add HTML5 support to IE, however

They are a PITA & don't work perfectly

“An indispensable tool.”

— Bruce Bowman, sr. product manager, Edge Tools & Services

## Download Modernizr 2.8.3

Use the commented, uncompressed Development version to develop with and learn from.

[View documentation](#)

 **DEVELOPMENT**

Then, dive into the Production build tool and pick just the tests you need!

 **PRODUCTION**  
Configure Your Build

**Modernizr** is a JavaScript library that detects HTML5 and CSS3 features in the user's browser.

## Why use Modernizr?

Taking advantage of cool new web technologies is great fun, until you have to support browsers that lag behind. Modernizr makes it easy for you to write conditional JavaScript *and* CSS to handle each situation, whether a browser supports a feature or not. It's perfect for doing progressive enhancement easily.

## How it works

Modernizr runs quickly on page load to detect features; it then creates a JavaScript object with the results, and adds classes to the `html` element for you to key your CSS on. Modernizr supports dozens of tests, and optionally includes [YepNope.js](#) for conditional loading of external `.js` and `.css` resources.

Check out the [full list of features](#) that Modernizr

## Get started with Modernizr

While Modernizr gives you finer control over the experience through JavaScript-driven feature detection, it is important to continue to use best practices throughout your development process. Use progressive enhancement wherever you can, and don't sacrifice accessibility for convenience or performance.

# HTML5 Cross Browser Polyfills

Edit

New Page

EvandroLG edited this page 16 days ago · 30 revisions

So here we're collecting all the shims, fallbacks, and polyfills in order to implant html5 functionality in browsers that don't natively support them.

The general idea is that: we, as developers, should be able to develop with the HTML5 apis, and scripts can create the methods and objects that should exist. Developing in this future-proof way means as users upgrade, your code doesn't have to change but users will move to the better, native experience cleanly.

Looking for a way to conditionally load these scripts client-side based on feature detects? See [Modernizr](#). Looking for a guide to writing your own polyfills? See [Writing Cross-Browser JavaScript Polyfills](#). Looking for a alphabetical guide on HTML5, CSS3, etc features and how you should use them? See [HTML5PLEASE](#).

```
<!--[if lt IE 9]>  
  <script src="dist/html5shiv.js"></script>  
<![endif]-->
```

`<!--[if lt IE 9]> ... <![endif]-->` indicates a *conditional comment*

Supported only by Internet Explorer 5–10

IE 10 does not support conditional comments if the HTML5 DTD is used, but will still work with them with earlier DTDs

Conditional comments are special comments that allow you to provide IE-specific HTML, CSS, & JavaScript

Every other browser sees a comment & ignores it

IE sees a comment, checks to see if it is a conditional comment, & if it is, it parses the code

```
[if lte IE 8]
```

Matches IE 8 & earlier

```
[if gt IE 5]
```

Matches IE versions later than IE 5

```
[if (gt IE 5)&(lt IE 7)]
```

Matches IE versions later than IE 5 & earlier than IE 7

```
[if (IE 6) | (IE 7)]
```

Matches IE 6 or IE 7

# Or match any version of IE

```
<!--[if IE]>  
<p>  
    You are using Internet Explorer. Please  
stop.  
</p>  
<![endif]-->
```

“Conditional comments really aren’t necessary anymore. If as a developer you focus on building to web standards and leverage feature detection instead of UA sniffing or conditional comments, you should be able to build and maintain standards-based sites that work easily across modern versions of IE and cross-browser.” —Rey, IE developer at Microsoft

“We implemented the HTML5 parser in IE10. The standard doesn’t mention conditional comments so they aren’t supported.” —Adrian, IE developer at Microsoft

# HTML5 video was meant to be this easy

html5media enables <video> and <audio> tags in all major browsers

All it takes is a single line of code to make HTML5 video and audio tags work in all major browsers.

- ✓ Nothing to install.
- ✓ Works in all browsers and phones.
- ✓ One of the fastest solutions available.

[html5media.info](http://html5media.info)

## How to enable <video> and <audio> tags in all major browsers

To make HTML5 video and audio tags work in all major browsers, simply add the following line of code somewhere in the <head> of your document.

```
<script src="//api.html5media.info/1.1.8/html5media.min.js"></script>
```

★ Home - schema.org

http://www.schema.org/

This site provides a collection of schemas that webmasters can use to markup HTML pages in ways recognized by major search providers, and that can also be used for structured data interoperability (e.g. in JSON). Search engines including Bing, Google, Yahoo! and Yandex rely on this markup to improve the display of search results, making it easier for people to find the right Web pages.

★ Front-end Style Guides ♦ 24 ways

http://24ways.org/2011/front-end-style-guides/

To counter this problem, graphic designers are often commissioned to produce style guides as part of a rebranding project. A style guide provides details such as how much white space should surround a logo, which typefaces and colours a brand uses, along with when and where it is appropriate to use them.

# developer.mozilla.org/en-US/docs/Web/HTML/Element

## HTML element reference

This HTML reference lists all **HTML elements**, defined in HTML5 or in a previous specification. When listed with angle brackets, they form *HTML tags*: `<elementname>`. Elements are entities specifying how HTML documents should be built, and what content should be placed in that part of an **HTML** document.

The symbol indicates that the element has been added in HTML5. Elements that are dimmed here have been modified or extended by the HTML5 specification. Dimmed elements are non-standard, obsolete, or deprecated; they may still be used in Web pages and should gradually be removed from existing ones to avoid unwanted results.

The symbol indicates that the element is defined in the **Component** collection of specifications.

### A

- `<a>`
- `<abbr>`
- `<acronym>`
- `<address>`
- `<applet>`
- `<area>`

### C

# HTML elements reference

[Web technology for developers](#) > [HTML: Hypertext Markup Language](#) > [HTML elements reference](#)

[English ▼](#)

## On this Page

- [Main root](#)
- [Document metadata](#)
- [Sectioning root](#)
- [Content sectioning](#)
- [Text content](#)
- [Inline text semantics](#)
- [Image and multimedia](#)
- [Embedded content](#)

This page lists all the [HTML elements](#), which are created using [tags](#). They are grouped by function to help you find what you have in mind easily. An alphabetical list of all elements is provided in the sidebar on every element's page as well as this one.

For more information about the basics of HTML elements and attributes, see [the section on elements in the Introduction to HTML article](#).

# Sectioning root

Element	Description
<code>&lt;body&gt;</code>	The <b>HTML <code>&lt;body&gt;</code> Element</b> represents the content of an HTML document. There can be only one <code>&lt;body&gt;</code> element in a document.

---

## Content sectioning

Content sectioning elements allow you to organize the document content into logical pieces. Use the sectioning elements to create a broad outline for your page content, including header and footer navigation, and heading elements to identify sections of content.

Element	Description
<code>&lt;address&gt;</code>	The <b>HTML <code>&lt;address&gt;</code> element</b> indicates that the enclosed HTML provides contact information for a person or people, or for an organization.
<code>&lt;article&gt;</code>	The <b>HTML <code>&lt;article&gt;</code> element</b> represents a self-contained composition in a document, page, application, or site, which is intended to be independently distributable or reusable (e.g., in syndication)

# Introduction

Web Inspector expands Safari's web browser with a set of web development tools. It provides a clean, unified, easy-to-use interface for developers to create advanced web apps. With Web Inspector, you can make changes to your webpage's underlying code, debug the code, and improve and enhance the performance of your website.

This tutorial walks you through a [code sample](#) to show you how to accomplish these tasks with Web Inspector. The code is from the web portfolio of a graphic designer.

# Meet the Microsoft Edge F12 Dev Tools

2017-2-8 • 4 min to read • Contributors

**Tip**

**Test on Microsoft Edge free from any browser:** We partnered with BrowserStack to get free live and automated testing on Microsoft Edge.

Microsoft Edge introduces great new improvements to F12 developer tools, including some of the most requested features from [UserVoice](#). The new tools are built in TypeScript, and are always running, so no reloads are required. In addition, F12 developer tools documentation is now fully available on [GitHub](#). From this point on, the docs will not only be influenced by your feedback, but you're invited to contribute and help shape our documentation.

# Using the F12 developer tools

Print

Share

This content refers to an older version of F12 developer tools. Please visit our [latest F12 tools documentation](#).

Using the F12 tools, you can debug, test, and speed up your webpages. Whether you need to fine tune your CSS layout or find a memory leak, you'll find tools to help here.

If you're looking for the **Tools** menu or toolbars in Internet Explorer 11, try:

- ["The menu bar and the toolbar are missing in Internet Explorer."](#)

If you got here by clicking an error message and simply want to avoid error messages in the future, try:

- [What should you do about Internet Explorer script errors?](#)
- [Question: I cannot turn off the automatic script debugger under explorer options.](#)

## The F12 tools at work

We rebuilt the F12 tools from the ground up in IE11. They have a brand new UI and new functionality to make your developing and debugging faster and easier. And we're going to be rolling out more improvements in updates.

Press the **F12** key on your keyboard to open the tools. If your keyboard doesn't have function keys, you can use the **Tools** menu.

There are eight distinct tools, each with their own tab in the F12 tools interface. Here you'll find an image of each tool, a quick summary of what it does and what's new, and a couple of typical development or debugging tasks the tool makes easier.

Validation

# Markup Validation Service

Check the markup (HTML, XHTML, ...) of Web documents

Validate by URI

Validate by File Upload

Validate by Direct Input

## Validate by URI

Validate a document online:

Bonus

The following slides contain extra, bonus information that we don't have time to cover in class

Metadata

<meta>

Some that do not exist (but people think they do) & should not be used

```
<meta name="copyright" content="...">
```

```
<meta name="robots" content="all">
```

(`content="all"` does not exist; `name="robots"` definitely does!)

							
<code>&lt;meta&gt;</code>	1	12	1	1	1	1	1
<code>name="referrer"</code>	11*	12†	36	7.1	8	21	46

\* Only starting in Windows 10 Creators Update

† Only supports values of `never`, `always`, `origin`, & `default`

`<base>`

*Base URL* to use for all relative URLs in a document

Not really used that often

No `</base>`!

```
<head>  
  <base href="http://www.foobar.com/">  
</head>
```

# Text Semantics

```
<big> ... </big>
```

Text in a *large font*, with nothing semantic about it

Deprecated in HTML 4.01

Removed in HTML5!

```
1 <p>  
2   That Cthulhu is <big>huge</big>!  
3 </p>
```

That Cthulhu is huge!

`<acronym> ... </acronym>`

*Acronym* (abbreviation pronounced as a word)

Should use `title` attribute to give the meaning

Some rendering engines display it with a dotted underline, & some add small caps

Obsolete! Removed in HTML5!

```
1 <p>
2   Be careful <acronym title="self-
   contained underwater breathing
   apparatus">scuba</acronym> diving near
   47°9'S 126°43'W, or you may run into
   Cthulhu, dreaming away his time in
   R'lyeh.
3 </p>
```

Be careful scuba diving near 47°9'S 126°43'W, or you may run into Cthulhu, dreaming away his time in R'lyeh.

# Multimedia

```
<video> ... </video>
```

Allows the browser to *play video*, completely obsoleting the need to use Flash or other plugins

Older rendering engines that don't support `<video>` can still use Flash embedded via `<object>`

```
<video>   
  <source>   
  <source>   
  <track>   
  <track>   
  <object>  
    <param>  
    <param>  
  </object>  
</video> 
```

HTML

```
1 <video controls="controls"
  poster="http://files.granneman.com/interviews/2010-0518-KMOV-News-4.png" width="640"
  height="360">

#### Source Code

```
<!-- "Video For Everybody" http://camendesign.com/code/video_for_everybody -->
<video controls="controls" poster="http://sandbox.thewikies.com/vfe-generator/images/big-buck-bunny_poster.jpg" width="640" height="360">
  <source src="http://clips.vorwaerts-gmbh.de/big_buck_bunny.mp4" type="video/mp4" />
  <source src="http://clips.vorwaerts-gmbh.de/big_buck_bunny.webm" type="video/webm" />
  <source src="http://clips.vorwaerts-gmbh.de/big_buck_bunny.ogv" type="video/ogg" />
  <object type="application/x-shockwave-flash" data="http://releases.flowplayer.org/swf/flowplayer-3.2.1.swf" width="640" height="360">
    <param name="movie" value="http://releases.flowplayer.org/swf/flowplayer-3.2.1.swf" />
    <param name="allowFullScreen" value="true" />
    <param name="wmode" value="transparent" />
    <param name="flashVars" value="config={'playlist':['http%3A%2F%2Fsandbox.thewikies.com%2Fvfe-generator%2Fimages%2Fbig-buck-bunny_poster.jpg'],{'url':'ht" />
    
  </object>
</video>
<p>
  <strong>Download video:</strong> <a href="http://clips.vorwaerts-gmbh.de/big_buck_bunny.mp4">MP4 format</a> | <a href="http://clips.vorwaerts-gmbh.de/big_buck_bunny.webm">WebM format</a> | <a href="http://clips.vorwaerts-gmbh.de/big_buck_bunny.ogv">Ogg format</a>
</p>
```

`<embed>`

Integrates *external applications or interactive content*  
(in other words, non-HTML plug-ins)

No fallback content

No `</embed>`!

`<embed>` is mostly around for historical reasons, so use  
`<video>`, `<audio>`, or `<object>` instead

# Attributes

**src**: Address of the resource

**width & height**

**type**: MIME type of embedded resource

```

1 <p>
2   <embed
   src="http://ftp.granneman.com.s3.amazonaws.com/super-mario-bros.mov"
   width="640" height="480"
   controller="true"></embed>
3 </p>

```

Frames

<frameset> & <frame>

<noframes>

What are frames for?

- » Present multiple documents in one window
- » Keep certain information visible while other information is scrolled or replaced

Frames (`<frameset>` & `<frame>`) are deprecated — & evil

Don't use them

- » Breaks the back button
- » Breaks bookmarking
- » Breaks printing
- » Difficult to implement
- » Easy to go down the rathole

## Computer Consultants of St. Louis

### Who we are

**CCSL, Computer Consultants of St. Louis**, is a regional not-for-profit association of professional consultants serving business computer users in the greater St. Louis area.

The goal of this website is to provide a connection for prospective users of consulting services, CCSL members and prospective members.

**Not another Staffing Company**

### Member Consultants

- ▶ Sami Allam, IBM  
314 495-6231  
Senior Technology Sales Leader
- ▶ Inter-Vision, Inc.  
Software development, program management, business strategy, Genex  
314 852-7356
- ▶ Marcel Brown Technology Services  
Apple, Linux, PCs, i-Pads, iPhones, Business consulting  
618 580-625
- ▶ Rainbow Consulting, Inc.  
Custom database development with Microsoft Access  
314 504-4234

## Network Integration Services

We specialize in using Network Technologies and the best of Open Source Software to solve complex business problems. The future of software technology lies in Open Software, where the *source code* for the entire system is readily available for inspection, review, and/or change.

On all platforms (Windows, Macintosh, Linux, Unix), Open Source Software is the way to use a system properly - lessened risk of viral payloads, flexibility not found with commercial software, and, most importantly, better support.

As Integrators, we also develop and install custom applications, both online and in-house, such as inventory and product data acquisition for real time data management. We can track product at creation and throughout assembly, providing historical data on how a unit was produced, providing real-time inventory updates, as well as reduction of raw material usage. Using Open Source Software, we can also interface with many existing computer systems and software, using vendor agnostic hardware from multiple manufacturers to provide you with the best solution for an application.

Our technical expertise that goes above and beyond the resources typically found in an organization, and we would certainly appreciate any comments or requests, .. [let us know!](#) .

[Open Tech Support Request](#)

Almost all of the cell service providers in the current market subsidize the cost of phones with long-term contracts. We have signed up with a Sprint Network Service provider called Ting, that provides the lowest cost service on the best network! Check out the site to the right for more information - as a reward, there is a \$25 credit for signing up!

<bgsound>

<nextid>

<nobr>

<plaintext>, <listing>, & <xmp>

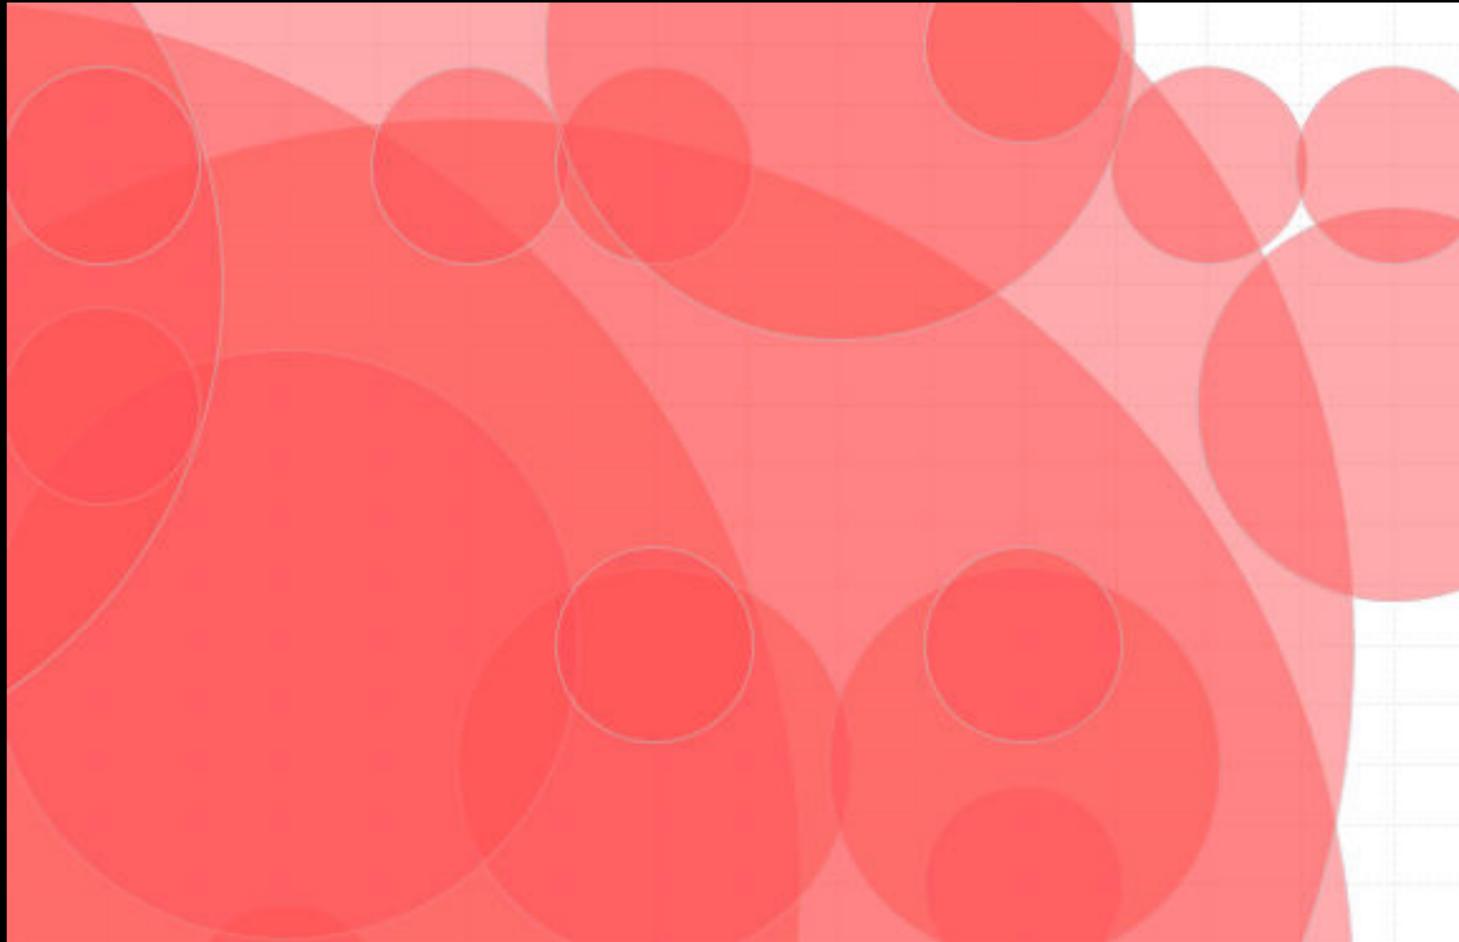

<spacer>

```
<applet> ... </applet>
```

Embed *Java applet*

Deprecated in HTML 4.01 in favor of `<object>`

Removed in HTML5!

```
<applet code="bubbles.class" width="500"  
height="500">  
    Java applet that draws animated bubbles.  
</applet>
```

`<bgsound>`

Plays a *background sound* on a webpage, which is obnoxious

Only ever supported by Internet Explorer

`<nextid>`

Used by the *NeXT Web Editor* to generate names for `<a>` & then automatically increment those names, keeping track of the last name used in `<head>`

Last used in HTML 2, & then only by the NeXT Web Editor

For more, see [www.the-pope.com/nextid.html](http://www.the-pope.com/nextid.html)

`<nobr> ... </nobr>`

*Prevents text from breaking* into new lines

Do not use! Last supported in IE 3!

`<plaintext>`

Renders everything after the tag as *raw text*, without interpreting any HTML

No closing tag, because *everything* after `<plaintext>` is considered raw text

Deprecated since HTML 2!

```
<listing> ... </listing>
```

Displays text *without interpreting any HTML*

Displayed with a monospaced font

Deprecated since HTML 3.2!

`<xmp> ... </xmp>`

Displays text *without interpreting any HTML*

Displayed with a monospaced font

Deprecated since HTML 3.2!

```
<spacer> ... </spacer>
```

Inserts *white spaces*

Only ever used by Netscape

# HTML Overview

## Elements, Attributes, Entities

# Changelog

2020-08-06 2.4: Added better examples of `<address>`; added note re specifying `width` & `height` for `<img>`; better screenshot showing headings create implied sections; Lovecraft-ized all `<a>` examples; renamed *Character Entities* to *Character References* & greatly expanded it

# Changelog

2020-07-14 2.3: Minor fixes & word changes; added & fixed arrows in `<a>`; added another way to create fake link; added examples of what never to use with `href`; added fun quiz of abbreviations & acronyms

2020-07-13 2.2: (con't. from ↓) re-took Anatomy of a Web Address screenshots; fixed bad link explaining how links work

# Changelog

2020-07-13 2.2: Changed “rendering engine” to “browsers” where appropriate; minor wording changes; Lovecraft-ized semantic HTML example; changed “small print” to “fine print” on `<small>`; (con’t. ↑)

2020-07-04 2.1: Added compatibility charts for `<img>`; added details about the `type` attribute for `<a>`, `<area>`, & `<link>`; moved `<font>`, `<basefont>`, `<tt>`, `<center>` into new section in *Bonus: Obsolete*; cleaned up *Bonus* section & moved some things

# Changelog

2020-07-03 2.0: (con't. from ↓) meaning of `<cite>` has changed, with examples; added `<svg>` example to `<map>`; added more detail about values for `<link>`'s `rel` & `integrity` attributes; added `as` to `<link>` attributes; moved list counters from *Lists* to *Tables & Lists* presentation; added compatibility table for `<iframe>` `srcdoc`; updated `<video>` & `<audio>` compatibility tables; updated *Bonus*; so many changes it's now bumped to 2.0!

# Changelog

2020-07-03 2.0: (con't. from ↓) added details re: `<canvas>` & moved into Scripting; streamlined *Tools*; updated screenshots of MDN Element Reference; added more info re: `<canvas>`, esp. re: responsiveness; removed ImgPlaceholder.com & added Unsplash & unsplash.it; changed *site root-relative* to *root-relative*; fixed `<a>` diagram missing arrows; added screenshot showing how headings become tables of contents via JS; added several examples for `<br>`; (con't. ↑)

# Changelog

2020-07-03 2.0: (con't. from ↓) moved `<hgroup>` under *Sectioning* & expanded it; moved `<blockquote>` into *Grouping*; moved `<q>` & `<cite>` into *Text Semantics*; added detail re: `<q>` incl. Chris Farley video; updated browser compatibility tables for *Sectioning*; updated wording for elements in *Grouping*; added more info & illustrations to `<pre>`; re-did `<main>`; replaced screenshots in `<aside>`; added `<menu>` & `<menuitem>` to *Lists*; added `<summary>` & `<details>`; (con't. ↑)

# Changelog

2020-07-03 2.0: (con't. from ↓) removed *Lines & Paragraphs* & moved `<p>`, `<br>`, `<wbr>`, & `<pre>` into *Grouping & Text Semantics*; re-ordered *Categorization* & added slide about sectioning, grouping, & text semantics; added `<body>` to *Sectioning*; added slide re: outlining to *Sectioning*; re-ordered elements in *Sectioning*; better explanation for `<article>`, & more on services & software that use it; moved details re: `<small>` out of sectioning & into *Sizes?*; added justification for `<header>`; (con't. ↑)

# Changelog

2020-07-03 2.0: (con't. from ↓) added Function to *Categorization* with tables; moved basic outline of `<html>`, `<head>`, & `<body>` at end of *Document Structure*; changed *Global Attributes* to *Attributes & Values* & completely re-did it; moved `<ruby>`, `<rt>`, `<rp>`, `<bdo>`, & `<bdi>` out of *Bonus* & into *For Developers Only*; added screenshot to `hidden`; improved screenshot & details for `tabindex`; removed Kevin Spacey from `<aside>` & added in Shakespeare's *Othello*; (con't. ↑)

# Changelog

2020-07-03 2.0: Updated number of elements; changed *Multimedia* to *Embedded Multimedia*; vastly improved semantic explanation & examples & moved from *Categorization* to *Semantic HTML*; re-did Categorization so it's now much better (con't. ↑)

2019-09-14 1.26: Removed Web Platform Daily from *Tools*; added compatibility chart for `<ol> reversed` attribute; added examples for `href` attribute; added screenshot in `<li>`; added `srcdoc` to `<iframe>`

# Changelog

2019-08-25 1.24: Added detail re: `<noscript>`;  
Googlebot no longer looks at `rel="prev" & "next"`;  
added grouped examples for almost all elements in Text  
Semantics; added note that `---` is not an em dash;  
added that headings are important for SEO

2018-12-10 1.23: (con't. from ↓) ..better `data-*`  
screenshot; added slides re: `target="_blank" &`  
`rel="noopener"`; added detail re: headings

# Changelog

2018-12-10 1.23: Added more detail re: customizing the Character Viewer; added CodePen example for placeholder.com; added `<pre>` example from my journals; added put page before site in `<title>`; replaced screenshots for `<aside>` & `<main>`; replaced `<figure>` screenshot & added screenshot for making caption without `<figure>`; replaced placeholder.com (because it sucks now) with ImgPlaceholder.com & added other placeholder sites; (con't. ↑)...

# Changelog

2018-11-08 1.22: Updated `<time>` screenshot; changed `src` to `alt` in value quotation example; added `type` to `<source>` with info re: MIME types; more info on `<video>` attributes for mobile

2018-10-24 1.21: Updated compatibility tables with new Safari & iOS logos & reordered columns; deleted a few useless pages in *Bonus*

2018-10-01 1.20: Re-ordered slides in *Categorization* & made them clearer; updated & fixed list of Boolean attributes; small fixes

# Changelog

2018-09-19 1.19: Added more formatting re: `<blockquote>`; fixed `<meter>/<progress>` table; added compatibility table for `<mark>`; better `<h1>` example for `<small>`; added links to slides for *Tables & Forms*; added links & details to Brackets & VSCode under *Tools*; added Matt's Rule for `<video>/<audio>`; added slide re: when to use `src` or `<source>`; added formatting rule in `<a>` for quotation marks inside values; switched out image for `<aside>` pull quote

# Changelog

2018-09-17 1.18: Added formatting guides for `<pre>`, `<dl>`, `<p>`, `<a>`, `<br>`, `<li>`, `<blockquote>`, `<address>`, & headings; added Gerhyrah's Rule, Eddie's Rule, Chris's Rule, & Christian's Rule for formatting; un-hid using `<section>` inside `<article>`

2018-05-07 1.17: Massively changed `<a>`; fixed minor formatting errors introduced when switching themes; added Gmail screenshots to `accesskey`; added examples for video & audio (!); added pictures for Reader View that were stripped out when switching themes (?)

# Changelog

2017-11-06 1.16: Added PRO TIP section for default/index/main pages; added FORMATTING GUIDE to `<p>` & `<hx>`; updated theme to updated Granneman 1.4 again; formatting fixes; added slides re: when to use `<figure>` with `<image>`; added page showing different quotation marks in different languages; added 🍏 in Unicode; changed `accesskey` to mostly don't use it; better slide introducing list types; re-organized `<video>` & `<audio>` to explain `<source>`; added further explanation of proper heading levels

# Changelog

2017-11-03 1.15: Clearer hyphens & dashes table; added Edge to Visualized Data compatibility chart; switched theme to Granneman 1.4; minor formatting fixes; added links to more info I've created on Brackets & Visual Studio Code; added slides on *boolean attributes*; placeholder.it has become placeholder.com; added note re: holder.js; `<img>` goes inside `<p>` &tc; added note re: correct formatting of `<source>`; made placeholder images into a PRO TIP; for `<img>`, added slide re: creating `css, images, js`

# Changelog

2017-11-02 1.14: Updated “HTML 4.01” & “HTML5” to use lining numbers; updated iOS logo & removed Edge if unnecessary in compatibility charts; added compatibility chart for *Sectioning*; better Lists table

2017-10-23 1.13: Hid examples in `<frame>`; moved Tools > Learning to *Bonus*; added Nu Validation Checker to *Validation*; updated `<small>` example to show CSS; better example for `<main>`; added JavaScript libraries for `<canvas>`; copied Separation of Concerns from *CSS Overview*; updated `<aside>` example

# Changelog

2017-10-20 1.12 (con't ↓): Removed `<q>` details; moved `<cite>` to *Bonus*; warned against “named anchors”; removed Nice Nice JPG (peace out, Vanilla); better example of using `<small>` to create subtitles with `<h2>`; better example for `<data>`; added details about `<time>` & `datetime`; updated compatibility table for `<time>` & `<data>`; reformatted `<link> rel` slide; in *Video*, moved `<object>`, Video for Everybody Generator, & `<embed>` example to *Bonus*; re-did `<audio>` & `<video>` compatibility tables

# Changelog

2017-10-20 1.12: Removed old Safari Reader examples & added new ones, including iOS; added `tel:` & `maps:` to `<a>`; improved `<meta>` examples & list; removed useless examples; better example of headings & implicit sections; better examples of `<nav>`; hid example in `<section>` (con't ↑)

2017-09-06 1.11: Added screenshots for websites of built-in browser dev tools; added websites under *Learning*; added new global attributes & compatibility table: `spellcheck`, `accesskey`, `contenteditable`, & `hidden`

# Changelog

2016-09-23 1.10: Better notation for placeholder images; lots of little cleanups of formatting & text; note re: `<br>`

2016-09-07 1.9: Lots of little fixes; better compatibility tables for `<main>` & many other elements; added that `<span>` & `<div>` draw boxes; added slide explaining *polyfills*; fixed formatting on several slides

2016-03-02 1.8: Added slide comparing headings to outline; added attributes for `<ol>`

# Changelog

2016-03-02 1.7: Switched theme to Georgia Pro; forgot to format `<canvas>` as code on support chart; added slide re: Microsoft ending support for pre-11 IE; added slide showing `<ol>` for navigation; fixed wording on `<p>` margins; reformatted `<hr>` pro tip; different recommendations for video & audio converters; tons of minor changes & fixes

2016-01-10 1.6: Added tiny detail to `<figure>`; added a lot more info re: `<meta>`; added tiny details re: URL fragments in `<a>`; added page about empty `mailto` links; added tiny detail to content models

# Changelog

2015-09-14 1.5: Added HTML Vocabulary; edited a tiny bit in `<a>`; more info about `<small>`

2015-05-20 1.4: Added slides to beginning re: slides & videos; renamed *Outlines & Sections* to *Outlining*; moved HTML Doctor HTML5 Element Flowchart to *Bonus*; added pull quote examples to `<aside>`; added example of HTML 4 use of `<address>`; added loop attribute to `<video>`; listed attributes for `<video>` & `<audio>` not supported on mobile; added example from textbook of heading as section; added example from textbook of `<figure>`

# Changelog

2015-03-06 1.3: Added note about built-in MP4 support in Firefox; added video of Kevin Spacey from *House of Cards* for `<aside>`; added rules & updated image for `data-*` global attribute; moved example of Microsoft Word's `<ins>` & `<del>`; added details about *resource inlining*

2015-01-12 1.2: Minor typos fixed; moved Safari Reader examples to `<article>` from `<main>`; fixed `<dl>` screenshot

2014-09-13 1.12: Changed “browser” to “rendering engine” almost everywhere; fixed text on fake link page; crossed out `<hgroup>`; minor typos fixed

# Changelog

2014-09-11 1.11: Fixed images for `<em>` & `<small>`; for `<ins>` & `<del>`, changed “Microsoft Word” to “word processors”; added image of Word’s Track Changes; indicated `<strike>` & `<s>` was in past; added image of typed page for `<u>`; moved `<kbd>` & `<samp>` interactions to *Bonus*
